MAINTENANCE AND ADJUSTMENT

Service

Your SSB radiotelephone has been factory aligned and tested to specification before shipment. Under normal circumstances the SSB radiotelephone will operate in accordance with these instructions. All adjustable trimmers and coils in your SSB radiotelephone has been adjusted at the factory and should only be readjusted by a qualified technician with proper test equipment. Attempting service or alignment without factory authorization can void the SSB radiotelephone's warranty.

When operated properly, the SSB radiotelephone will provide many years of service without requiring realignment. The information in this section gives some general service procedures which can be accomplished without sophisticated test equipment.

Should it ever become necessary to return the equipment to your dealer or service center for repair, pack it in its original box and packing, and include a full description of the problems involved. Also include your telephone number. You need not return accessory items unless directly related to the service problem.

Service note :

If you desire to correspond on a technical or operational problem, please make your note short, complete, and to the point, and PLEASE make it readable.

Please list: Model and Serial Number

The problem you are having.

Please give sufficient detail to diagnose. Information such as other equipment in the station, meter readings and anything else you feel might be useful in attempting diagnosis .

Caution :

Do not pack the equipment in crushed newspapers for shipment. Extensive damage may result during shipment.

Notes :

1. Record the Date of Purchase, Serial Number and Dealer from whom purchased.
2. For your own information, retain a written record of any maintenance performed on the unit.
3. When claiming warranty service, a photocopy of the bill of sale, or other proof of purchase showing the date of sale must accompany the radio.

MAINTENANCE AND ADJUSTMENT

Adjustment

1-1. Cover removal

Before removing the cover, turn the DC power supply's power switch OFF and disconnect the power cable.
Do not pinch wiring when opening or closing cases.

Remove the top cover (8 screws), and the bottom cover (4 screws) from radiotelephone.

1-2. Sub chassis removal

Remove the 4 screws as shown in the diagram.
Open in a counterclockwise direction.

1-3. Beep tone level

Turn VR7 to the desired BEEP tone level.

1-4. Alarm tone level

1. Press the ALARM key to select the ALARM TEST mode.
2. Turn VR6 to the desired ALARM tone level.

INSTALLATION INSTRUCTIONS

Mounting bracket

When installing the SSB radiotelephone in a vessel consider the ease of operation and safety when selecting the location for the mounting bracket.

1. Install the bracket using the supplied flat washers and self tapping screws, or spring washers and bolts (4 each). You may attach the supplied rubber cushion to the bracket.

2. Attach the supplied metal fittings with the 4 flat head screws to the side of the radiotelephone.

3. Attach the supplied shoulder bolt loosely 3,4 mm away to the side of the radiotelephone.

4. Align the grooves in the bracket with the rear shoulder bolts and slide the radiotelephone to the rear .

5. The angle of the bracket may be adjusted to three of possible viewing angles. Select the desired angle.

6. Hold the radiotelephone in place and tighten the shoulder bolt with knob.

Microphone hanger

TKM-707

INSTALLATION INSTRUCTIONS

Connection

This radiotelephone requires a maximum of 30 A at 13.6VDC \pm 15% when transmitting at full power. Do not exceed the length of the supplied power cable.

Without antenna coupler

The type of antenna that is used will greatly affect the performance of the equipment. Use a properly adjusted antenna, of good quality, to enable your equipment to perform at its best. The antenna input impedance is 50 ohms. Use 50 ohm coaxial cable such as RG-8U or 8D-2V for this connection. If the antenna is far from the transceiver the use of low loss coaxial cable, such as RG-8U is recommended. Match the impedance of the coaxial cable and that of the antenna so that the SWR is less than 1.5. The protection circuit in the transceiver will activate if the SWR is particularly poor (greater than 3). High SWR values will cause the transmitter output to drop.

With antenna coupler

A wire antenna must be in the range from 2 to 24 MHz and having a total length of 12 to 23 meters. When the radiotelephone is operated only on low frequencies, a longer antenna is preferable. The antenna should be erected as high as possible. The insulator should be able to withstand high transmitter power levels without leakage.

Typical installation and connection

Connect the Antenna connector of the radiotelephone to the RF IN jack with the coaxial cable, such as RG-8U are recommended. Connect the 6P connector of the supplied control cable to the radiotelephone. Please refer to the MAT-100 Instruction Manual to connect with the cable to the MAT-100.

CIRCUIT DESCRIPTION

Frequency Configuration

The TKM-707 operates as a double conversion system for both transmission and reception. (See Figure 1.)

• Receiver system

The receive signal from the ANT terminal passes through the final unit and the TX-RX unit LPF and is applied directly to mixers Q9 and Q10 (2SK125-5). Here the signal is mixed with the first local oscillator frequency (71.395~101.295 MHz) from the PLL in order to generate the first IF signal of 71.295 MHz. The receive frequency may be fine tuned with the clarifier by varying the first local oscillator frequency.

The 71.295 MHz first IF signal passes through a monolithic filter (MCF) and is mixed with the second local oscillator frequency (60.6 MHz) by MIX FETs Q13 and Q14 (2SK520(K44)) to generate a 10.695 MHz second IF signal. The second local oscillator signal is generated by the TX-RX unit Q90 and Q91 (2SC2714(Y)) and is then doubled by Q56 (2SC2714(Y)).

The second IF signal (10.695 MHz) passes through a crystal filter, and is then applied to IC2 : KCD03 where the signal is demodulated. The demodulated audio output is amplified by the AF preamplifier and power amplifier to drive the speaker.

• Transmitter system

The audio signal from the microphone is amplified by mic amplifiers Q37 and Q38 : 2SC3324(G), and is then combined with the carrier oscillator in the balanced modulator, (IC6 : μ PC1037A) to generate the TX first IF (10.695 MHz).

In the H3E mode, a carrier signal is added to the TX first IF (10.695 MHz). The TX first IF is then mixed with the second local oscillator frequency (60.6 MHz) by IC7 : SN16913P in the same manner as the receiver system, to produce a 71.295 MHz signal. This signal is then mixed with the PLL first local oscillator frequency in order to generate a transmit signal.

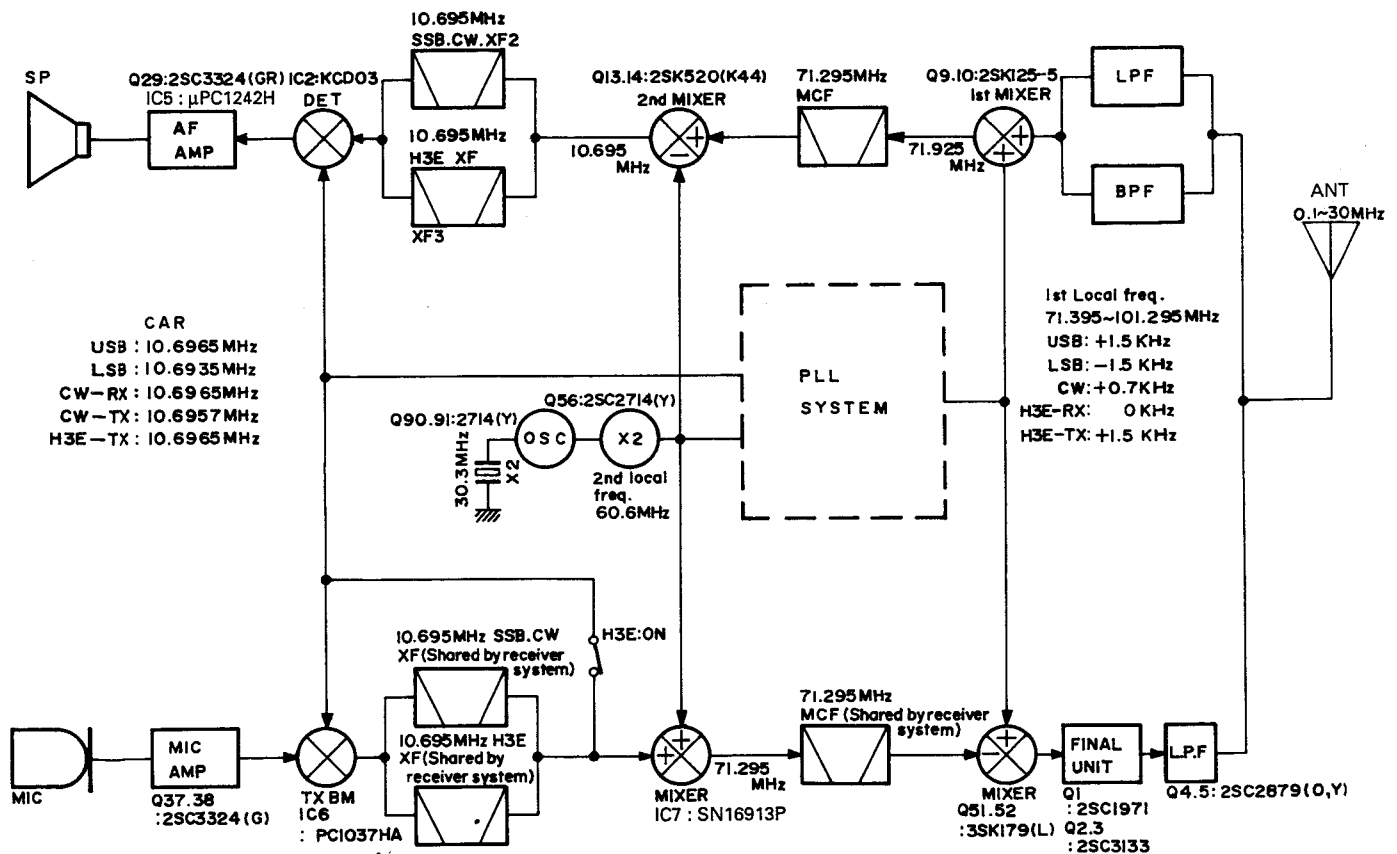

Fig. 1 Frequency configuration

CIRCUIT DESCRIPTION

PLL (Phase Locked Loop)

The TKM-707 PLL is divided into a HET loop and a CAR loop. The HET loop consists of loop A and loop B, and the CAR loop consists of loop C. Figures 2 and 3 show a block diagram of the HET and CAR loops. The following paragraphs describe loops A, B, and C.

The reference frequency for loops A, B, and C is 10.1 MHz. This frequency is generated by dividing the 30.3 MHz reference oscillation frequency by 3. Therefore, the frequency accuracy of the HET and CAR is determined by the 30.3 MHz oscillation circuit.

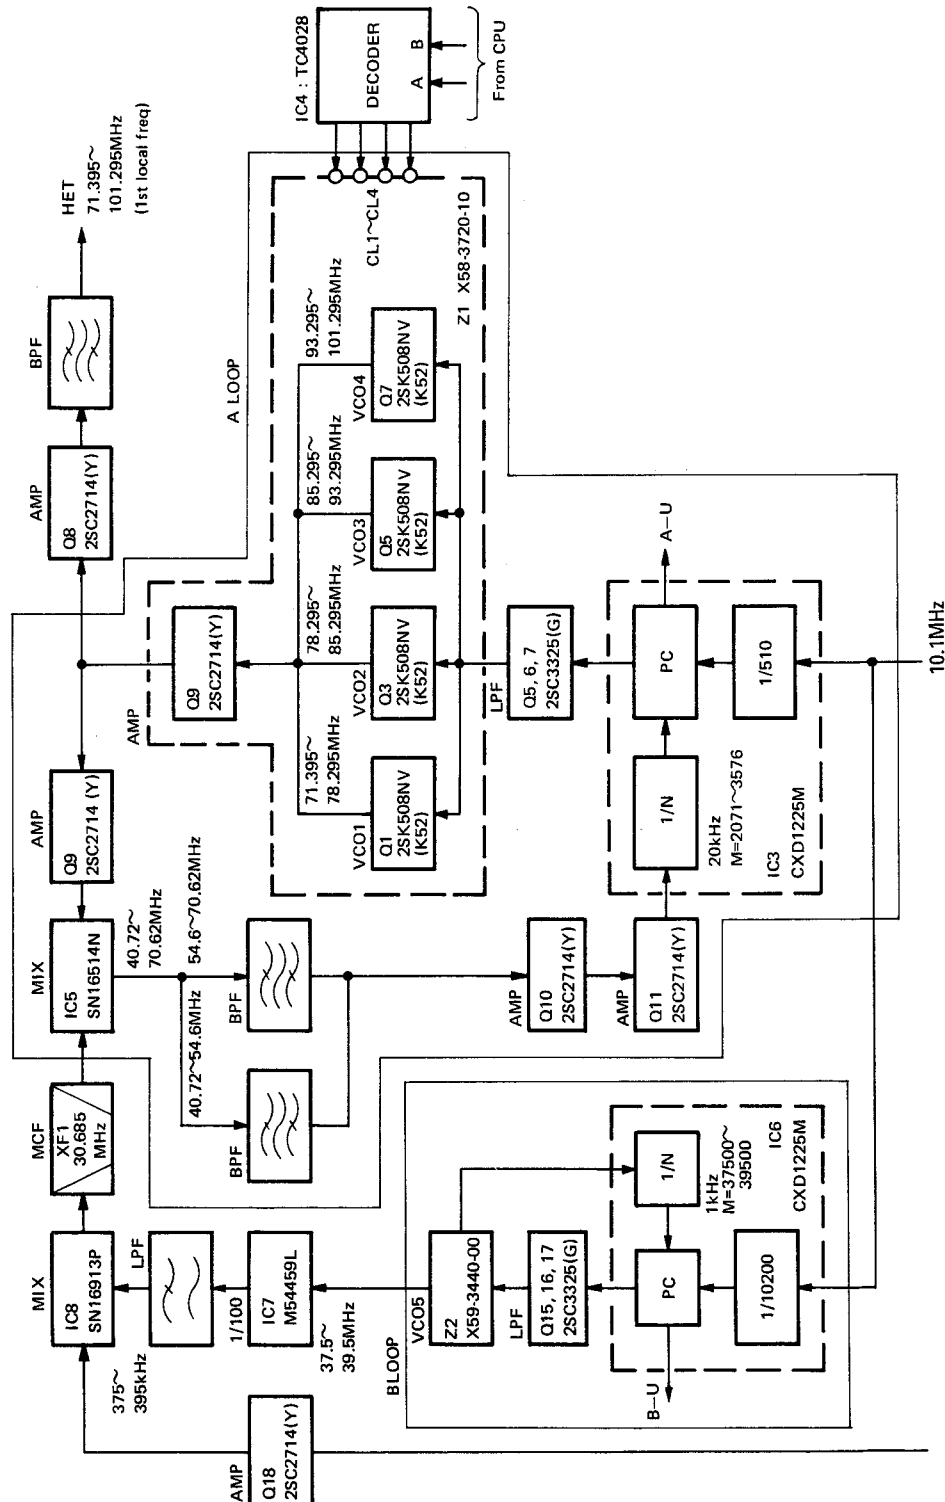

Fig. 2 Block diagram of PLL HET loop

CIRCUIT DESCRIPTION

Loop B generates a 37.5~39.5 MHz signal via IC6 (CXD1225M) with a 1 kHz comparison frequency. The 37.5~39.5 MHz signal is generated by VCO6 (X59-3440-00), then divided by 100 in IC7 : M54459L to generate a 10 Hz steps. Fine-frequency adjustment by means of the clarifier is added to loop B under microprocessor control. The 375~395 kHz output signal that was divided by 100 by IC7 is mixed with the 30.3 MHz signal by IC8 : SN16913P in order to generate a 30.675~30.695 MHz signal. This frequency passes through MCF (XF1; 30.685 MHz) and enters IC5 (SN76514N).

Loop A generates a 71.395~101.295 MHz signal via IC3 (CXD1225M) with a comparison frequency of 20 kHz. This signal becomes the HET oscillator signal. The loop A VCO (X58-3720-10) consists of four separate VCO circuits which are selected by IC4 (TC4028) according to the control data from the microprocessor. (See Table 1.) Part of the loop A VCO output passes through the buffer amplifier of Q9 : 2SC2714(Y) and is applied to IC5. The signal is then mixed with the signal from loop B in IC5 : SN76514N (40.72~70.62 MHz). The resulting 40.72~70.62 MHz signal passes through BPF1 and BPF2. VCO1 and VCO2 pass the signal through BPF1, and VCO3 and VCO4 pass it through BPF2. The signal passing through the BPF is amplified by Q10 and Q11 : 2SC2714(Y) and is then applied to PLL IC3 (CXD1225M).

Loop C generates a 59.3~59.7 MHz via IC9 (CXD1225M) with a 2 kHz comparison. This VCO output is divided by 100 by IC10 : M54459L, and is mixed with 10.1 MHz by IC11 : SN16913P to generate a 10.693~10.697 MHz signal. The 10.693~10.697 MHz signal passes through ceramic filter CF1 to become the CAR signal. The CAR signal changes with the mode. It is amplified by Q27 and is then sent to the TX-RX unit.

Frequency Function		0.1~7MHz	7~14MHz	14~22MHz	22~30MHz
Microprocessor control signal	V1	0	1	0	1
	V2	0	0	1	1
VCO		VCO1	VCO2	VCO3	VCO4
BPF		BPF1	BPF1	BPF2	BPF2

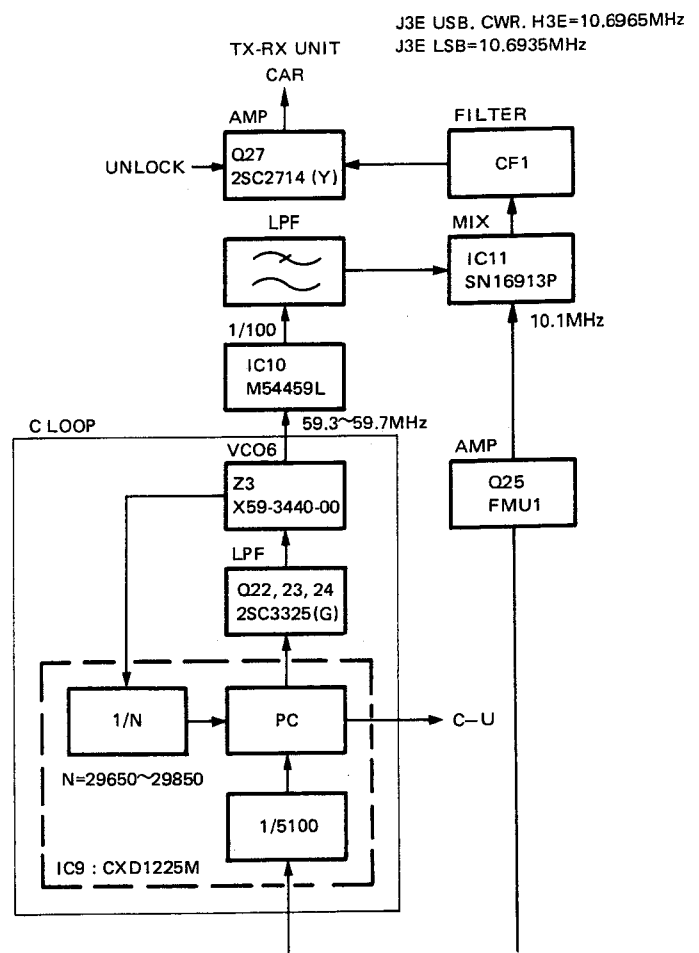

Fig. 3 Block diagram of PLL CAR loop

CIRCUIT DESCRIPTION

- CAR stop circuit in AM receive mode**

In the CW and SSB modes, the 8 V DC power for the last mixer IC (IC11 : SN16913P) of the CAR loop is supplied through Q26 : 2SC2712(Y). In the H3E receive mode, 8 V is applied to pin 3 of the TX-RX unit shift register IC10 (TC9174F) according to the data supplied from the microprocessor. The 8 V is supplied to the control unit via the CAR coaxial cable.

This sets Q28 : DTC114EK on, changes Q26 from on to off, disables IC11, and stops CAR.

- Unlock circuit**

Normally 8 V (8C) is fed to the HET and CAR transistors Q8 and Q27 via Q21. (Q21 is on.) When any of the PLL loops (loop A, B, and C) should unlock, pin 8 of the corresponding PLL IC (IC3, IC6, IC9 : CXD1225M) will go H (5V). This causes Q19 to switch on, and Q20 and Q21 to switch off. This action causes the voltage applied to Q8 and Q27 to be removed. Meanwhile Q29 switches on, and LED D10 turns on to indicate the unlocked state.

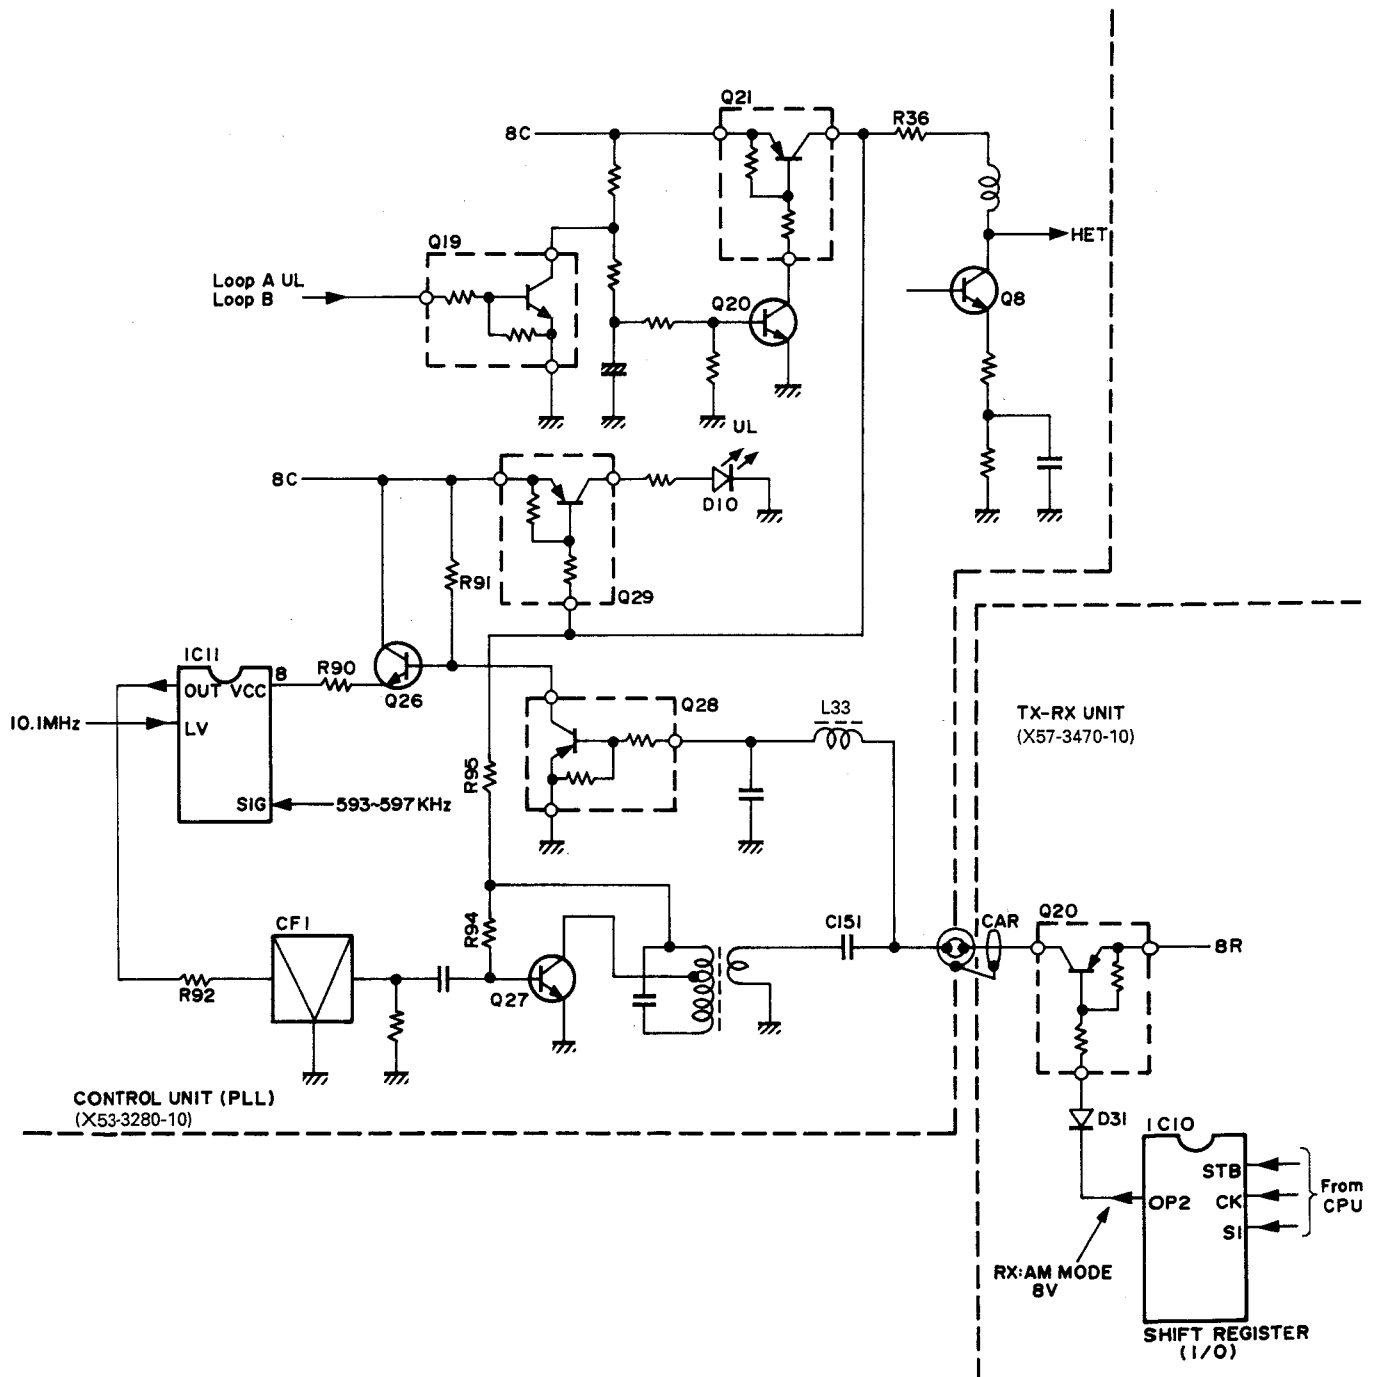

Fig. 4 CAR stop circuit in AM receive mode and PLL unlock circuit

CIRCUIT DESCRIPTION

Control Unit

• Control unit configuration

The main LSI chips in the control unit include CPU : IC302, ROM : IC310, EEPROM : IC311, and extended I/O IC : IC300.

The CPU reads the program from the ROM, reads/writes memory channel data to EEPROM, and inputs and outputs signals from the CPU ports or extended I/O IC ports.

The address signal (8 low-order bits) required for the CPU to access the ROM, EEPROM, and extended I/O IC is multiplexed with other data and output to the bus line. The address is maintained for the necessary period of time by latching IC303.

The chip select (CS) signal, which selects a the desired device (ROM, EEPROM, etc.), is supplied to each device by decoding the address signal by IC304 : TC74HC138AF.

• Bus operation

The ROM (IC310), EEPROM (IC311), and extended I/O IC (IC300) are connected to the CPU (IC302) via the bus line. When the CPU accesses these ICs (IC310, IC311, and IC300), the address signals (A13 to A15) output from the CPU are decoded by IC304, and the IC is specified by the CS signal. IC310 (ROM) uses the CPU address signal A15 as a CS signal.

Table 2 is a truth table for IC304.

This bus is a multiplexed bus onto which an address code and data are output alternately. Therefore, when the CPU accesses one of the ICs, the necessary address signal is latched by IC303.

This latch uses the positive pulse applied to the ALE pin, after the CPU outputs an address.

INPUT			OUTPUT							
A	B	C	$\overline{Y_0}$	$\overline{Y_1}$	$\overline{Y_2}$	$\overline{Y_3}$	$\overline{Y_4}$	$\overline{Y_5}$	$\overline{Y_6}$	$\overline{Y_7}$

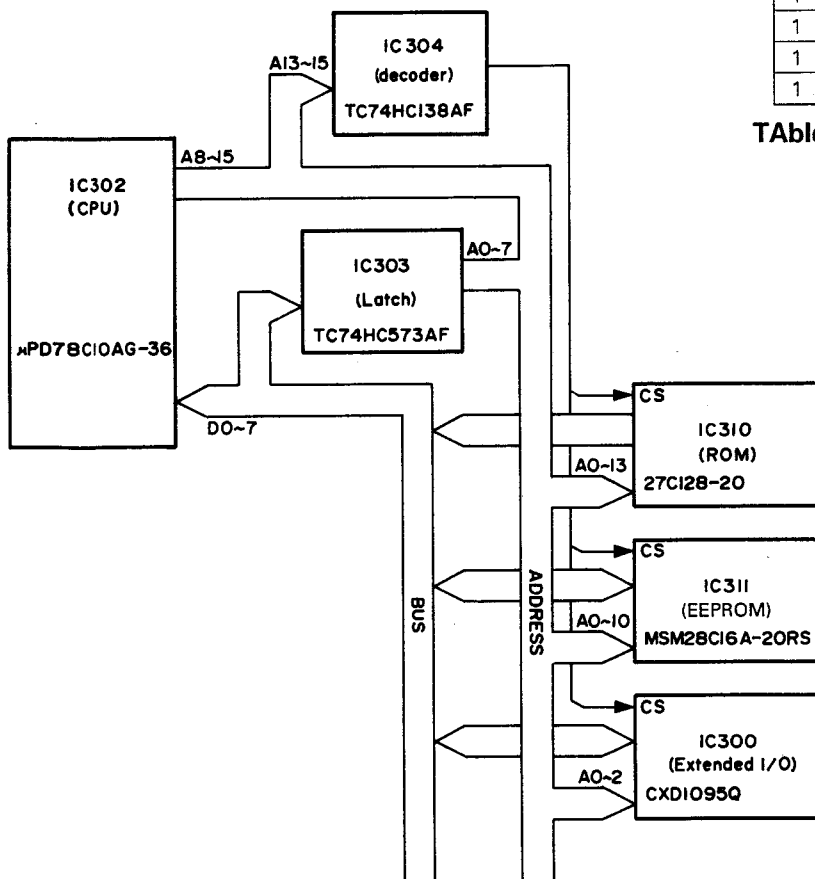

Fig. 5 Control unit block diagram

CIRCUIT DESCRIPTION

• Key scan

Active L pulses are output from S0 (PC0 pin 11) to S6 (PC7 pin 18), in the order listed, and input through ports K0 (PB3 pin 5) to K4 (PB7 pin 9). Which switch has been pressed is determined by finding where the lines intersect on the matrix.

• Display

The CPU calculates the display data and transfers 112-bit serial data to the LCD module. The LCD driver IC in the LCD module lights the LCD dynamically with 50% duty cycle.

Figure 6 shows the serial data waveform.

matrix		Scan input

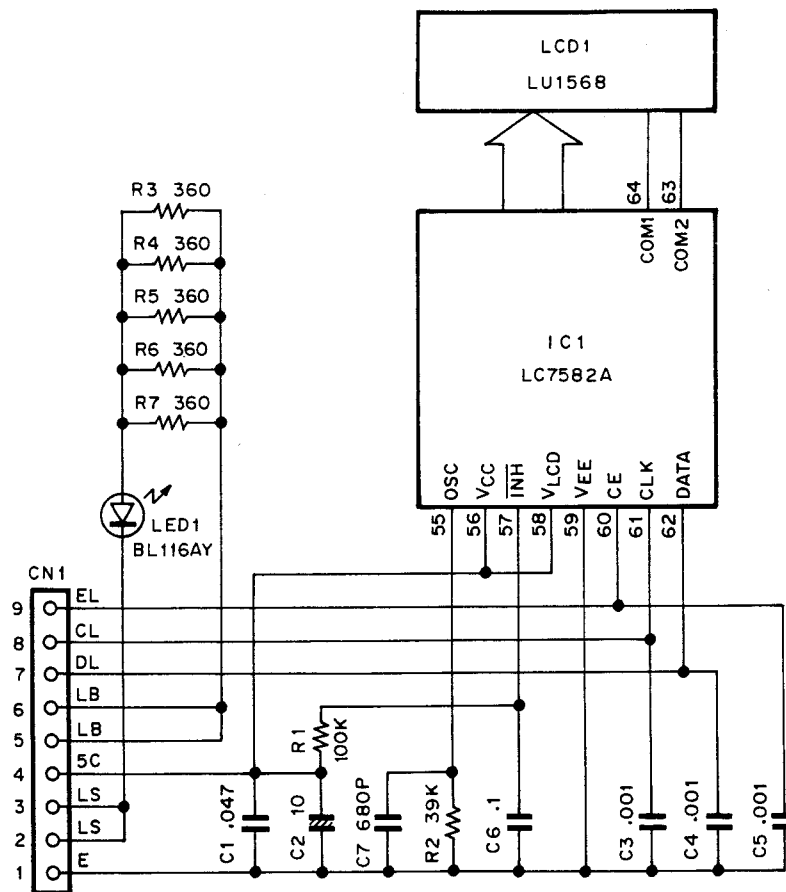

Fig. 7 LCD module circuit diagram

CIRCUIT DESCRIPTION

- **Backup**

The TKM-707 backs up data in two ways. The first is a semipermanent backup that backs up memory channel data in the nonvolatile memory EEPROM. The second is a lithium cell that backs up the operation status in the CPU RAM.

The CPU backup is performed by monitoring the CB (13.6 V) line. If the voltage falls below the prescribed level, the CPU STOP pin is activated and CPU power consumption is reduced. When the power consumption is low, the CPU stops generating clock signal, which places each port is at a high impedance level.

Fig. 8 Backup circuit

- **System reset circuit**

IC305 (M51951BML) is the system reset IC that monitors the power supply voltage. If the voltage falls below the prescribed level, it outputs a reset signal to the main CPU to stop execution and inhibit memory write functions.

If the power supply voltage again exceeds the prescribed level when the power is on, the reset signal is released, the main CPU is initialized, and execution is resumed after the time constant of R375 and C379 has elapsed.

Fig. 9 Reset circuit and timing chart

CIRCUIT DESCRIPTION

- **Clarifier**

When the clarifier knob is turned a DC voltage corresponding to the rotation angle is produced. The input voltage is A/D converted by the CPU and PLL data is controlled.

The data is controlled in the CPU so that the curve

shown in Figure 10-2 is obtained. Operation of the circuit is improved by enlarging the zero area at the center of the rotation angle.

The zero point of the clarifier is adjusted by setting the knob to the mechanical center, then setting zero with VR303.

Fig. 10-1 Clarifier circuit

Fine adjustment frequency

Fig. 10-2

- **Encoder**

When the encoder is turned, a pulse having a 90-degree phase shift is input to the CPU. The EN1 pulse is applied to PC3 of pin 20 and INT1 of pin 26. The CPU detects the trailing edge of the waveform via PC3 and the leading edge by INT1 and begins interrupt operation. It checks PC1 of pin 18, judges the rotational direction, counts 1, then performs up/down processing of the frequency and channel data.

Since the encoder is a mechanical device, it produces chattering, but it is designed not to malfunction by software means.

- **Receive signal switching**

The MU signal switches the AF signal and the BLK signal switches the RF signal.

When switching from one PLL loop to another an active H-pulse is generated to suppress any noise.

In the TX mode and during memory write operation, the MU signal is output continuously to cut off the audio.

Fig. 11 Encoder circuit

CIRCUIT DESCRIPTION

- Squelch control**

The CPU inputs the SQL SW status by means of a key scan.

When the SQL SW is off, the SQS signal goes L to

open squelch.

When the SQL SW is on and the VSQ signal is H, the SQS signal goes H to close squelch. If the VSQ signal is L, the SQS signal goes L.

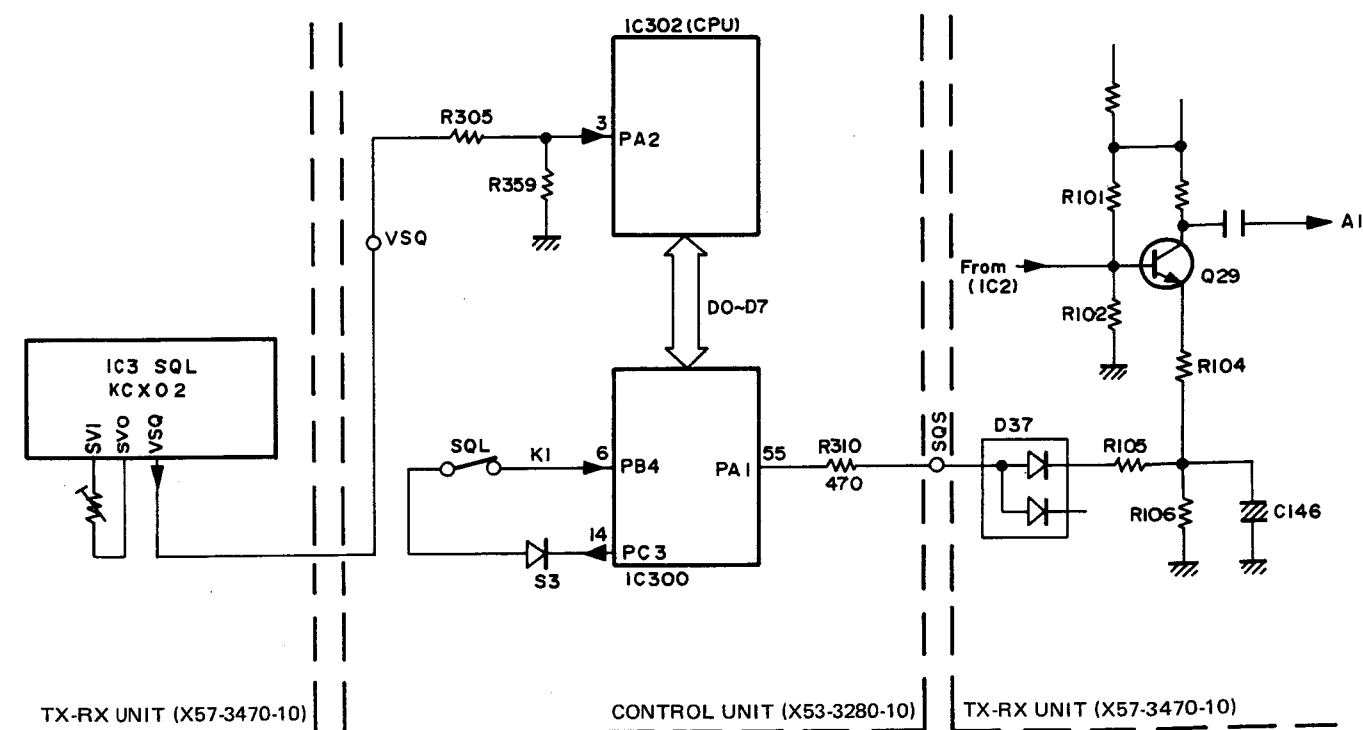

Fig. 12 Squelch control circuit

- Noise blanker switching**

The CPU inputs the NB SW status by key scan.

When the NB SW is pressed, the display changes from OFF to NB1 to NB2 to OFF, and the NB1/NB2 port is controlled as listed in Table 3.

When the display is NB2, both NB1 and NB2 operate.

Display	NB1	NB2
OFF	L	L
NB1	H	L
NB2	H	H

Table 3

Fig. 13 Noise blanker switching circuit

CIRCUIT DESCRIPTION

• Dimmer

Each time the DIMMER SW is pressed, it changes from MAX to MEDIUM to MIN to OFF to MAX. Table 4 lists the PA4 to PA6 outputs.

Brightness	PA6	PA5	PA4
MAX	L	L	H
MED	L	H	L
MIN	H	L	L
OFF	L	L	L

Table 4

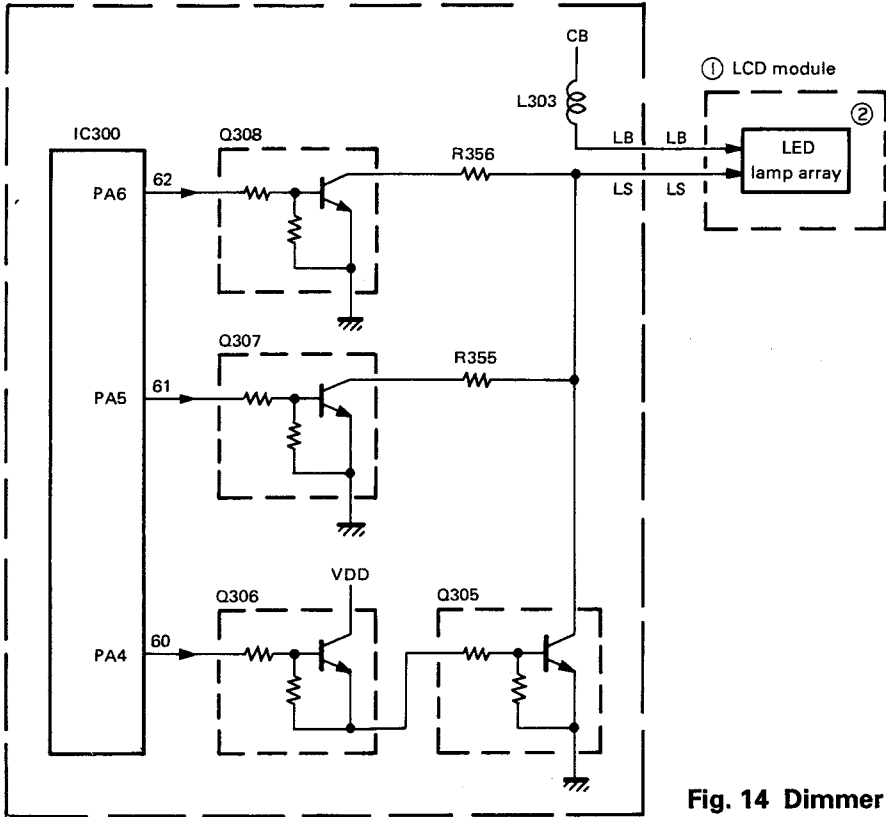

Fig. 14 Dimmer circuit

• Tone output

The 1300/2200 Hz alarm tone is obtained by generating a pseudo sine wave via D/A means and passing it through the LPF.

The 1300 Hz tone has a step waveform with a 1/13 cycle, and the 2200 Hz tone has a step waveform with a 1/8 cycle.

Fig. 15 Tone output circuit

BPF NO.	Frequency (MHz)
B1	0.1~1.5999
B2	1.6~2.9999
B3	3.0~4.9999
B4	5.0~6.9999
B5	7.0~8.9999
B6	9.0~13.9999
B7	14.0~17.9999
B8	18.0~29.9999

Table 5 Receiving bandpass filter table

- **Automatic gain control (AGC) circuit**

The output of final-stage intermediate-frequency (IF) amplifier Q15 (3SK131(M)) is amplified by IF hybrid IC2 (KCD03) to produce an AGC voltage with a voltage doubler rectifier. This AGC voltage is fed to a two-stage IF amplifier in IC2 and the second gates of FETs Q12 and Q15 (3SK131(M)) to control the gain.

- **Squelch circuit**

The detected output of IC2 is partially sent to hybrid IC3 (KCX02) and is used as a squelch circuit signal. A high or low digital VSQ signal is output from hybrid IC3, then input to the CPU. The CPU outputs an SQS signal and mutes it using audio frequency (AF) preamplifier Q29 (2SC3324(G)) for squelch control.

- **Noise blanker (NB) circuit**

The input of the NB circuit is extracted from the outputs of second-stage RX mix FETs Q13 and Q14 (2SK520(K44)) and is applied to the NB hybrid IC1 (KCX01). The input signal is amplified and detected by IC1 then output as a noise blanking signal. The operation of IF amplifier Q15 (3SK131(M)) is stopped by NB switching transistor Q16. Noise components are then eliminated.

NB1 is used for short-duration pulses such as ignition noise. NB7 is used for longer-duration, long duration pulse noise such as the woodpecker.

Transmitting Circuit Configuration

The transmitter utilizes a double-conversion system. An audio signal from the microphone is amplified by microphone amplifiers Q37 and Q38 (2SC3324(G)) and modulated by double-balanced mixer (BM) IC6 (μ PC1037A). The modulated output is converted to a DSB signal, passed through 10.695 MHz single-side-band (SSB) filter XF2, then converted to an SSB signal. The SSB signal is then amplified by TX IF amplifier Q45 (3SK131(M)) in the first stage. An ALC voltage is applied to the second gate of Q45 by a dual MOS FET IF amplifier to control the transmitter output.

Audio signals in the H3E mode are also modulated, like an SSB signal, passed through a filter, then amplified by Q45. A carrier signal is added to the amplified signal by a circuit consisting of Q48 and Q49 producing an H3E signal.

The 10.695 MHz signal amplified by Q45 is mixed with a 60.6 MHz signal by second-stage mixer IC7 (SN16913P), then converted to a 71.295 MHz signal. Spurious components in the 71.295 MHz signal are eliminated by a monolithic crystal filter (MCF) (XF1). The resultant signal is amplified by dual gate MOS FET amplifier Q50 (3SK129(L)). When a high SWR is felt at the antenna, the ALC2 voltage at the second gate of Q50 is reduced and the transmitting output level is lowered to protect the transistor in the final stage. The amplified transmitting IF signal is input to a double-balanced mixer consisting of FETs Q51 and Q52 (3SK179(L)), then converted to the desired transmitting frequency. The converted signal is passes through a low-pass filter to eliminate higher harmonic components and is then amplified to the signal level required for a final-stage drive circuit by transistor Q53 (2SC2053).

The drive output is sent to the final-stage unit and amplified to a sufficient output level by wideband pre-drive amplifier Q1 (2SC1971), wideband push-pull drive amplifiers Q2 and Q3 (2SC3133), and wideband push-pull amplifiers Q4 and Q5 (2SC2879(O,Y)) in the final stage.

Predrive amplifier Q1 has a fixed bias and is thermally coupled with diode D1. The bias currents of drive amplifiers Q2 and Q3 and final-stage amplifiers Q4 and Q5 are adjusted by VR1 and VR2. Diode D2 is thermally coupled with Q2, D3 with Q4, and D4 with Q6. Diodes D1 through D4 compensate for the temperature in each stage and prevent thermal runaway.

CIRCUIT DESCRIPTION

The outputs of Q4 and Q5 in the final stages pass through low-pass filters for each band to eliminate higher harmonic components. The low-pass filter outputs pass through transmit relay K115 and is applied to the antenna terminal. The ALC voltage is detected by L121, and the antenna current is detected by L123.

For bandwidth information, the 3-bit information items (FL1 through FL3) sent from the TX-RX unit are converted to 7 bits by decoder IC101. Q107 through Q113 turn on and relays K101 through K114 are changed over for bandwidth selection. The bandwidth information can be checked by checking that test points LPF1 through LPF7 are high (5 V). The band select relay can also be checked by checking that LPF1B through LPF7B

are 5 V. The table 6 outlines the bandwidth information.

Transmission and reception can be checked when test points TX and RX are 5 V.

FL1	FL2	FL3	LPF NO.	Frequency (MHz)
H	H	H	1	1.6050~2.9999
L	H	H	2	3.0000~4.9999
H	L	H	3	5.0000~6.9999
L	L	H	4	7.0000~8.9999
H	H	L	5	9.0000~13.9999
L	H	L	6	14.0000~17.9999
H	L	L	7	18.0000~27.9999

Table 6 Bandwidth information

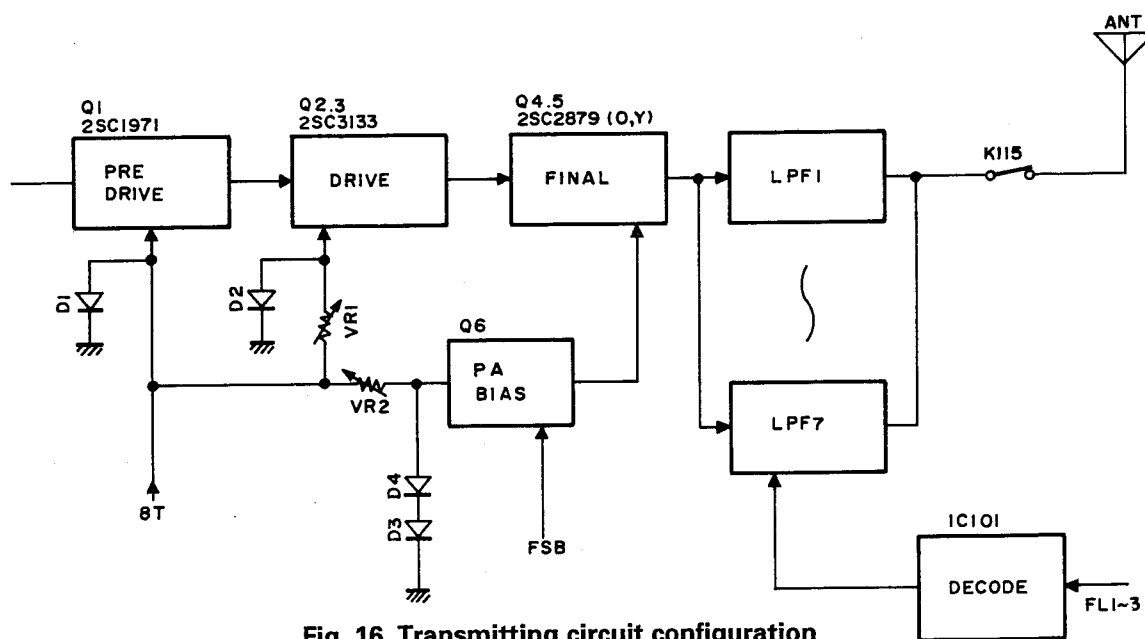

Fig. 16 Transmitting circuit configuration

• ALC voltage detector and antenna current detector circuits

The ALC voltage is detected by L121. Forward waves are detected by D102, converted to an AC voltage, then sent to the TX-RX unit. The voltage is approximately 10 V in the low- to high-band range with respect to the 47 kΩ load of R112. Reflected waves are detected by D101 and sent to the TX-RX unit. The

reflected waves are adjusted by TC101 so that the VSR voltage is minimum (approximately 0.5 V) when a 4 MHz frequency is output at 110 W.

For antenna current detection, the voltage detected by L123 is detected by D103 and fed to the TX-RX unit. The voltage is approximately 6 V in the low- to high-band range with respect to the 47 kΩ load.

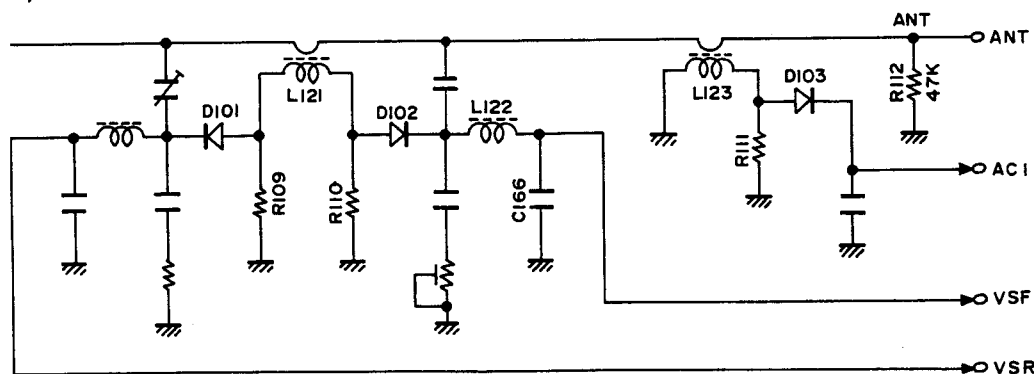

Fig. 17 ALC voltage and antenna current detection

The final stage has a temperature protection circuit consisting of fan module unit Z1 and an overvoltage protection circuit consisting of D6, Q7, and Q8.

When the heat sink temperature rises and the temperature of thermistor TH1 (10 k Ω) exceeds approximately 55 degrees C, comparator IC1 (b/2) of the fan

When the heat sink temperature becomes still higher and the thermistor temperature exceeds 90 degrees C, comparator IC1 (a/2) is activated and the output goes high (approximately 7 V). The power select circuit is then activated reducing the output power to approximately 30 W.

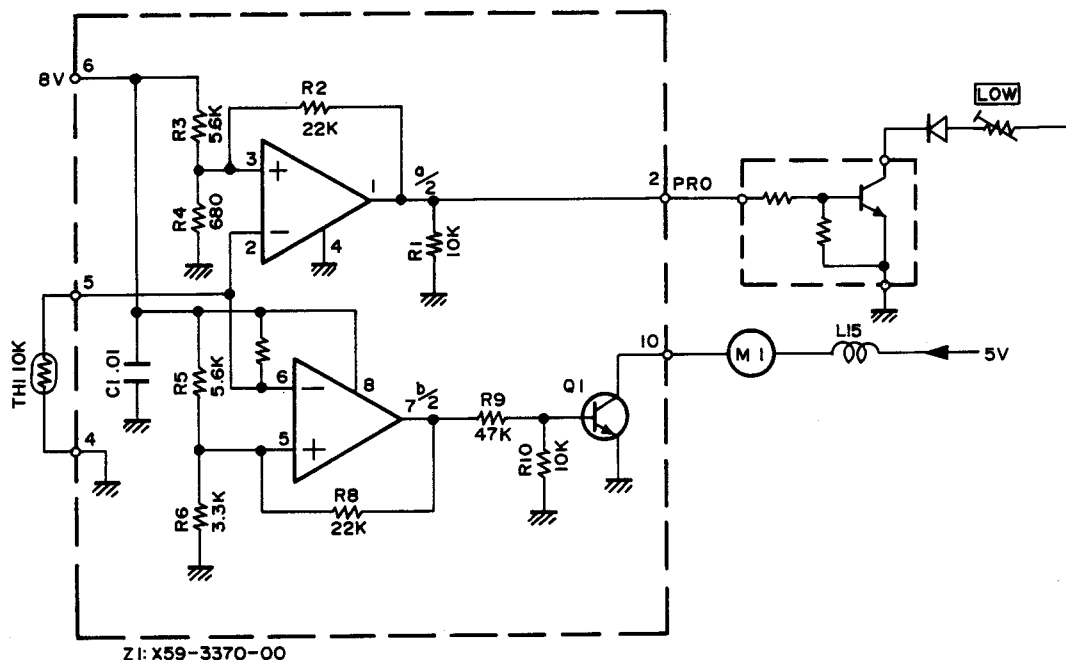

Fig. 18 Temperature protection circuit

When the supply voltage exceeds approximately 20 V, the base of switching transistor Q7 goes high turning it on; which in turn turns on Q8. As a result, relay K1 connected to the POWER switch is set off and the power is switched off.

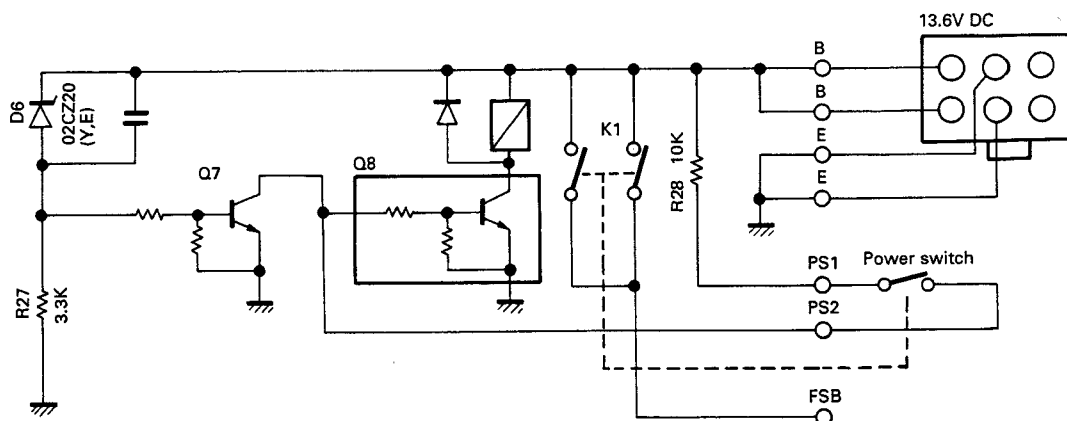

Fig. 19 Overvoltage protection circuit

CIRCUIT DESCRIPTION

• Receiving front end protection circuit

The voltage (8 V) from 8R turns Q104 on, turns Q103 on, (2SA1362(Y)), which then sets receiving select relay K116 on during reception. Therefore, the signal from the ANT terminal is sent to the RA terminal via relay K116.

When a HF signal exceeding approximately 10 W is input to the ANT terminal during reception, forward

waves are detected by D101. This signal level is enough to turn Q106 (2SC2712(Y)) on; which turns Q105 (DTA144) off, then on. Q104 (DTD114EK) then changes from on to off, and Q103 changes from on to off. Thus, receiving select relay K116 is not activated, so the high-frequency power is not fed to the RA terminal to protect the receiving front end.

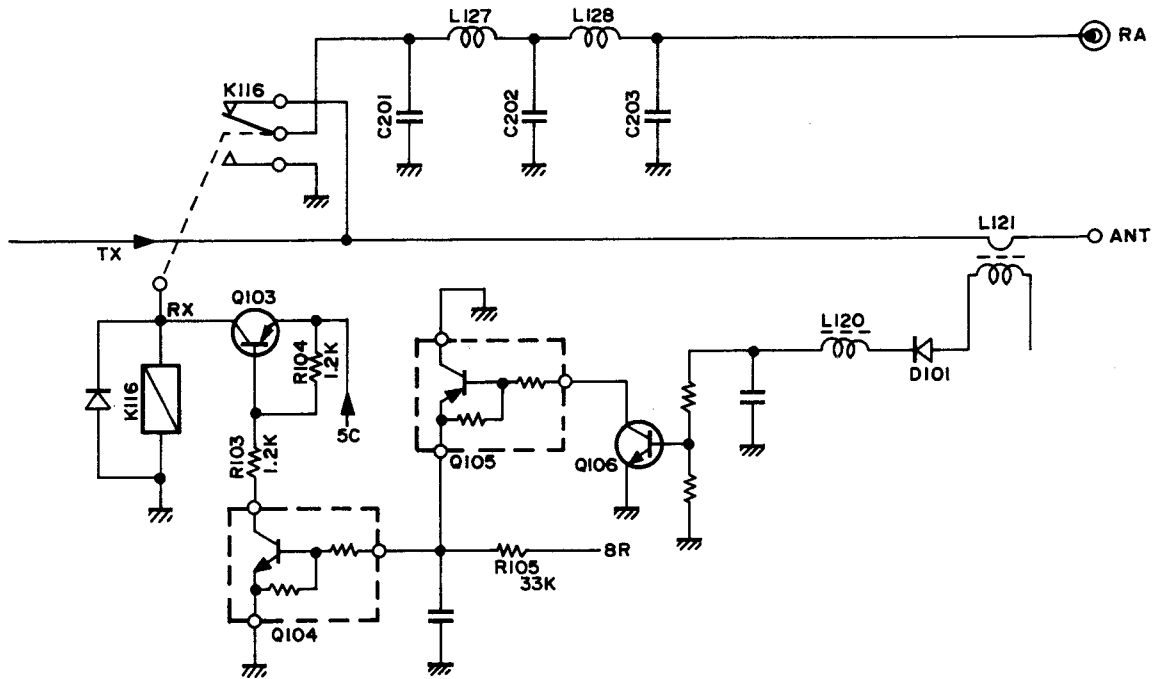

Fig. 20 Receiving front end protection circuit

MIC terminal

See Figure 21 and Table 7.

Fig. 21 MIC pin (Viewed from front panel)

Pin No.	Pin Name	Description
①	MIC	MIC impedance approx. 600Ω
②	SS	STANDBY switch.
③	DOWN	Frequency and channel number decrement.
④	UP	Frequency and channel number increment.
⑤	8M	8V (100mA [MAX]).
⑥	SPS	Receiving audio output.
⑦	GND (MIC)	Ground for MIC.
⑧	GND	Ground.

Table 7 MIC pin description

CIRCUIT DESCRIPTION

• When using handset instead of microphone

1) Connecting the handset

Connect an 8-pin MIC plug (E07-0852-15) to the handset as shown in Figure 22. Add a resistor (100 k Ω) in series to pin 3 (DOWN line). Then, connect the resistor to the off hook switch. Now when the handset is lifted, the off hook circuit is activated. The off hook switch operation is described below. (See Figures 23 and 24.)

The DOWN line is connected to the A/D input terminal of the CPU. The CPU judges whether the A/D input terminal output is a DOWN switch signal or handset off hook switch signal in accordance with the DOWN line level. When the handset off hook switch is detected as being on, the APO signal goes high. Internal and external speaker outputs are then cut off irrespective of the SP switch setting.

2) Using the handset

1. Connect an 8-pin MIC plug to the handset as described above.
2. Insert the connected 8-pin MIC plug into the MIC jack on the front panel.
3. When the handset is placed on a hanger as shown in Figure 23, the received tone is heard from an internal or external speaker (the SP switch is activated). The handset speaker is cut off.
4. When the handset is removed from the hanger as shown in Figure 24, the internal or external speaker is cut off (the SP switch is deactivated). The received tone is heard from the handset speaker.
5. When the PTT switch of the handset is pressed, the set enters the transmission mode.
6. Speak over the handset microphone.
7. When the PTT switch is released the set enters the reception mode.

Fig. 22 Handset connection

Fig. 23 When placing handset on hanger

Fig. 24 When removing handset from hanger

CIRCUIT DESCRIPTION

Antenna Current Level Meter Selection

• Preparations

1. Remove the upper and lower case fastening screws.
2. Remove the fastening screws of the heat sink covering the top of the set and push the heat sink down to the left.
3. The TX-RX unit (X57-3470-10) is under the heat sink, so sliding switch S1 of the unit can now be seen.

When connecting an antenna coupler, set slide switch S1 of the TX-RX unit (X57-3470-10) to EXT. Now the current of the antenna connected to the antenna coupler can be detected. The detected current can be displayed by using a level meter. When sliding switch S1 is set to INT, the current of the antenna connected to the ANT terminal of the set is detected. The detected current is also displayed by using a level meter.

Fig. 25 Antenna current detector circuit selection
(Viewed from the panel top)

Operation Mode

The operation mode consists of user and dealer modes. They differ in specifications for reset and memory channel entry. Memory channel operation will be described first.

• User mode

This mode is selected by users. Only a receiving frequency can be written into the memory channel. Memory channels written in the dealer mode cannot be overwritten.

• Dealer mode

This mode is used when dealers write the transmitting and receiving frequencies assigned to users into the memory channel. For M type radios, the mode is returned to the user mode after programming is completed. For K type, the mode is set to the dealer mode at the factory.

Setting of Functions by Diode Removal

As Table 8 outlines, functions can be set with diodes D311 through D314 of the control unit (X53-3280-10).

• Function setting

1. Set the POWER switch to OFF.
2. Set the diode corresponding to the desired function.
3. Set the POWER switch to ON.

• Description of table 8

When D311 is removed, the ALARM key on the front panel is ineffective.

When D312 is removed, a wave-type least significant bit (LSB) can be sent.

When D313 is removed, the frequency selected in the DIAL mode can be sent.

When D314 is removed, a wave-type H3E signal can be sent.

Ref. No.	Function	Diode provided	
		Yes	No
D311	Alarm key	Valid	Invalid
D312	LSB sending	Impossible	Possible
D313	Dial mode sending	Impossible	Possible
D314	H3E sending	Impossible	Possible

Table 8 Setting of functions with diodes

Setting of Functions with DIP Switch

As Table 9 outlines, functions can be set with DIP switches S301 of the control unit (X53-3280-10).

• Function setting

1. Set the POWER switch to OFF.
2. Set the DIP switch corresponding to the desired function.
3. Set the POWER switch to ON.

• Description of table 9

When Switch 1 is set to ON, operation is set in the user mode. When it is set to OFF, operation is set in the dealer mode.

Switches 2 and 3 must remain set to ON.

When switch 4 is set to ON, the destination is set to America. When it is set to OFF, the destination is set to other foreign countries.

1) For America (K type)

A frequency has been preset to memory groups A and B. Factory setting is as follows:

- Switch 1 : OFF
- Switch 2 : ON
- Switch 3 : ON
- Switch 4 : ON

CIRCUIT DESCRIPTION

2) For other foreign countries (M type)

A frequency has not been preset to memory groups A and B. Factory setting is as follows:

- Switch 1 : ON
- Switch 2 : ON
- Switch 3 : ON
- Switch 4 : OFF

Switch No.	Function	Switch setting	
		ON	OFF
1	Operation mode	User	Dealer
4	Destination	America	Other foreign countries

Table 9 Setting of functions with DIP switches

Reset

- **How to reset**

1. Set the POWER switch to OFF.
2. Set the POWER switch to ON while pressing the keys listed in Table 10.

- **Description of table 10**

When the system is reset in the dealer and user modes with the ENT key, the initial mode is entered with the memory backed up.

When the system is reset in the user mode with the C/FUNC key, only the memory channel written in the user mode is cleared. The initial mode is then entered.

1) For foreign countries' destination (except America)

When the system is reset in the dealer mode with the C/FUNC key, all memory channels are cleared. The initial mode is then entered.

2) For American destination

When the system is reset in the dealer mode, with the C/FUNC key, the preset channel is set in the initial mode. Other memory channels are cleared. The initial mode is then entered.

Operation mode	Key used	Write data		
		Preset channel	Dealer write channel	User write channel
Dealer mode	ENT	Back up	Back up	Back up
	C/F	Set	Cleared	Cleared
User mode	ENT	Back up	Back up	Back up
	C/F	Back up	Back up	Cleared

Table 10 Reset

Memory

- **Before memory write**

Reset the system as follows before writing the memory:

1. Set the set in the dealer mode.
2. Set the POWER switch to ON while pressing the C/FUNC key.

- **Memory write**

Write the memory in accordance with the Operation Manual (write the memory while the set is in dealer mode). Receiving and transmitting frequencies can be written in the dealer mode.

- **After memory write**

After memory write is completed, set the set in the user mode. The memory written in the dealer mode cannot be rewritten.

- **The ALARM key is ineffective**

(See Setting of Functions by Diode Removal.)

- **Wave-type LSB and H3E signals can be sent**

(See Setting of Functions by Diode Removal.)

- **A frequency can be sent in the dial mode**

(See Setting of Functions by Diode Removal.)

- **Destination selection**

See Setting of Functions with DIP Switches.

DESCRIPTION OF COMPONENTS

FINAL UNIT (X45-3370-10)

Component	Use/Function	Operation/Condition/Compatibility
IC1	8V AVR	Input 13.6V, output 8V.
IC2	5V AVR	Input 13.6V, output 5V.
IC101	Band data decode	See to circuit description.
Q1	Pre drive amplifier	Wide freq. amplifier.
Q2, 3	Drive amplifier	Pushpull amplifier.
Q4, 5	Final amplifier	Pushpull amplifier.
Q6	Bias voltage supply to Q4, 5.	Current amplifier when transmit.
Q7	Over voltage detection	Turn on when voltage (approx. 20V or more).
Q8	Power switch relay control	On when power switch is turned on.
Q101, 102	TX/RX select relay switch	Turn ON when transmit (TX terminal : 5V).
Q103, 104	TX/RX select relay switch	Turn ON when receive (RX terminal : 5V).
Q105	RX protection circuit switch	Turn ON when operate to protection circuit (Normally OFF).
Q106	RX protection circuit detection	
Q107	LPF select relay switch	Turn ON 5~6.9999MHz (LPF3B terminal : 5V).
Q108	LPF select relay switch	Turn ON 18~29.9999MHz (LPF7B terminal : 5V).
Q109	LPF select relay switch	Turn ON 9~13.9999MHz (LPF5B terminal : 5V).
Q110	LPF select relay switch	Turn ON 7~8.9999MHz (LPF4B terminal : 5V).
Q111	LPF select relay switch	Turn ON 14~17.9999MHz (LPF6B terminal : 5V).
Q112	LPF select relay switch	Turn ON ~2.9999MHz (LPF1B terminal : 5V).
Q113	LPF select relay switch	Turn ON 3~4.9999MHz (LPF2B terminal : 5V).
Q114	LPF select relay switch	Turn ON 14~17.9999MHz (LPF6 terminal : 5V).
Q115	LPF select relay switch	Turn ON 18~29.9999MHz (LPF7 terminal : 5V).
Q116	LPF select relay switch	Turn ON ~2.9999MHz (LPF1 terminal : 5V).
Q117	LPF select relay switch	Turn ON 3~4.9999MHz (LPF2 terminal : 5V).
Q118	LPF select relay switch	Turn ON 9~13.9999MHz (LPF5 terminal : 5V).
Q119	LPF select relay switch	Turn ON 5~6.9999MHz (LPF3 terminal : 5V).
Q120	LPF select relay switch	Turn ON 7~8.9999MHz (LPF4 terminal : 5V).
D1	Temperature compensation of Q1 bias current	Temperature compensation of pre drive transistor Q1.
D2	Temperature compensation of Q2, 3 bias current	Temperature compensation of drive transistor Q2.
D3	Temperature compensation of Q4, 5 bias current	Temperature compensation of final transistor Q4.
D4	Q6 temperature compensation	Temperature compensation of final bias transistor Q6.
D5	Power supply reverse current protection	Power voltage supply.
D6	AVR	Over voltage protection.
D7	Surge absorb for relay	Relay for power switch.
D8	Surge absorb for motor	Fan motor.
D101	Reflection wave rectifier	RF rectifier.
D102	Forward wave rectifier	RF rectifier.
D103	Antenna current rectifier	RF rectifier.
D104	Lightning surge protection	Surge absorb to ANT terminal.
D105	Surge absorb for relay	For transmit relay.
D106	Surge absorb for relay	For receive relay.
D107	Surge absorb for relay	5~6.9999MHz. LPF relay.
D108	Surge absorb for relay	18~29.9999MHz. LPF relay.
D109	Surge absorb for relay	9~13.9999MHz. LPF relay.
D110	Surge absorb for relay	7~8.9999MHz. LPF relay.
D111	Surge absorb for relay	14~17.9999MHz. LPF relay.
D112	Surge absorb for relay	0.1000~2.9999MHz. LPF relay.
D113	Surge absorb for relay	3~4.9999MHz. LPF relay.
TH1	Temperature protection detection	Approx 55°C when fan motor operates. Approx 45°C when fan motor stopped. Approx 90°C when RF power dropped. Approx 80°C when RF power recovered.

Q301	Tuning finished response switch	ON when tuning finished. Normaly OFF.																																				
Q302	Tuning through indication switch	ON when tuning through. Normaly OFF.																																				

DESCRIPTION OF COMPONENTS

Component	Use/Function	Operation/Condition/Compatibility
Q303	Tuning through response switch	ON when tuning through. Normally OFF.
Q304	STBY switch	ON in transmit. OFF in received.
Q305, 306	Dimmer switch	ON : "H".
Q307	Dimmer switch	ON : "MED".
Q308	Dimmer switch	ON : LOW.
Q309	LB AVR protection	LB AVR. Output approx 10.5V.
Q310	LB AVR protection	ON when LB AVR output is shorted.
Q311	KEY switch	MARK : ON SPACE : OFF.
Q312	Back-up switch	ON when back-up mode. Normally OFF.
D1	Reverse current protection	
D2, 3	A loop B.P.F select switch	ON when operative to A loop VCO1 or VCO2.
D4, 5	A loop B.P.F select switch	ON when operative to A loop VCO3 or VCO4.
D6	Reverse current protection	
D7	B loop VCO vari-cap	
D8	Reverse current protection	
D9	C loop VCO vari-cap	
D301	LB AVR ref.	
D302~306	Reverse current protection	RF feed back of another circuit when using scan signal.
D307	CPU input port protection	
D308	Voltage detection for back-up	
D309	IC312 port protection	
D310	Reverse current protection	Charge protection of the lithium battery when normal operation.
D311~314	Function setting	See to circuit description.
D315	Discharge value select	Occur to reset signal quickly when power supply is turned OFF.
D316	Level shift	IC301 output calibration.
D317	Reverse current protection	Protect for back-up current that draw to unwanted circuit.

TX-RX UNIT (X57-3470-10)

Component	Use/Function	Operation/Condition/Compatibility
IC1	Noise blanker	
IC2	IF	10.695MHz IF 2nd stage. SSB, AM detection with AGC amplifier.
IC3	Squelch	
IC4(1/2)	S-meter amplifier	
IC5	Audio power amplifier	
IC6	Transmit balanced modulator	5 : MIC input 3 : Output 7 : Carrier input
IC7	Transmit 1st mixer	1 : Output 71.295MHz 2 : Local input 60.6MHz 5 : IF input 10.695MHz
IC8(1/2)	ALC amplifier	Controlled ALC voltage by FWD voltage.
IC8(2/2)	ALC amplifier	Protect for Q50 G2 voltage dropped when abnormal.
IC9	Receive B.P.F select	Converted to parallel data from serial data.
IC10	Select	MODE, RF power select. Converted to parallel data from serial data of L.P.F information.
IC11	8V AVR	Input SB line output 8V.
Q1	BPF8 switching	Turn ON when received 18.0000~30.0000MHz.
Q2	BPF7 switching	Turn ON when received 14.0000~17.9999MHz.
Q3	BPF6 switching	Turn ON when received 9.0000~13.9999MHz.
Q4	BPF5 switching	Turn ON when received 7.0000~8.9999MHz.
Q5	BPF4 switching	Turn ON when received 5.0000~6.9999MHz.
Q6	BPF3 switching	Turn ON when received 3.0000~4.9999MHz.
Q7	BPF2 switching	Turn ON when received 1.6000~2.9999MHz.
Q8	BPF1 switching	Turn ON when received 0.1~1.5999MHz.
Q9, 10	Receive 1st mixer	
Q11	1st mixer switching	Turn ON in received.
Q12	1st IF amplifier	71.295MHz.

DESCRIPTION OF COMPONENTS

Component	Use/FUnction	Operation/Condition/Compatibility
Q13, 14	Receive 2nd mixer	<p>71.295MHz → ⊗ ← 60.6MHz → 10.695MHz</p>
Q15	2nd IF amplifier	10.695MHz.
Q16	2nd IF amplifier switching	Normally turn ON. Turn OFF when, NB GATE is LOW, BLK is HI.
Q17	2nd IF amplifier switching	Turn ON when BLK is 'H'.
Q18	NB1 switching	Turn ON when NB1 operates.
Q19	NB2 switching	Turn ON when NB2 operates.
Q20	H3E receive +B voltage switching	Turn ON when H3E received (8V).
Q21	H3E receive +B voltage switching	Turn ON when H3E received.
Q24	Filter switching	
Q25	AMB switching	Turn ON when H3E mode.
Q26	SCB switching	Turn OFF when H3E mode normally 8V.
Q27	H3E DET switching	Turn OFF when H3E mode.
Q28	AGC switching	Turn ON when H3E mode.
Q29	AF pre-amplifier	
Q30	Mute switching	ON in mute squelch is turned on. Normally OFF.
Q31	Alarm switching	OFF in alarm is turned on. Normally on.
Q32	Alarm switching	ON in alarm is turned on.
Q33	Alarm switching	
Q34	Alarm amplifier	
Q35	Internal speaker switching	ON when internal speaker is turned OFF.
Q36	RELAY switching	Turn ON when transmit.
Q37, 38	Mic amplifier	
Q39	Mic switching	ON when alarm operation.
Q40	Mic amplifier mute	Turn ON when CW mode (8V).
Q44	CAR switching	Turn ON when received.
Q45	Transmit IF amplifier	10.695MHz.
Q47	Transmit IF amplifier switch	Turn ON when transmit (8V). Occur to keying timing.
Q48	H3E CAR switching	Turn ON when H3E transmissstion.
Q49	CAR amplifier	H3E carrier. 60.6MHz.
Q50	Transmit IF amplifier	71.295MHz.
Q51, 52	Transmit 2nd mixer	71.295MHz → Transmit freq.
Q53	Transmit RF amplifier	
Q54	HET amplifier.	71.395~101.295MHz.
Q55	REF buffer amplifier	30.3MHz.
Q56	Doubler	30.3 X 2=60.6MHz.
Q57	2nd HET amplifier	60.6MHz.
Q58	Temperature protection switch	Turn ON temperature protection operation. Normally OFF.
Q59	Reflection ALC amplifier	
Q60	8R switching	Turn ON when receive (8V).
Q64	8R switching	Turn ON when receive.
Q65	8R switching	Turn OFF when receive.
Q66	8T switching	Turn ON when transmit (8V).
Q67	8T switching	Turn ON when transmit.
Q68	8T switching	Turn OFF when transmit.
D1~4	Front-end protection	
D5, 6	BPF8 switching	Turn ON when received 18.0000~30.0000MHz.
D7, 8	BPF7 switching	Turn ON when received 14.0000~17.9999MHz.
D9, 10	BPF6 switching	Turn ON when received 9.0000~13.9999MHz.
D11, 12	BPF5 switching	Turn ON when received 7.0000~8.9999MHz.
D13, 14	BPF4 switching	Turn ON when received 5.0000~6.9999MHz.
D15, 16	BPF3 switching	Turn ON when received 3.0000~4.9999MHz.

DESCRIPTION OF COMPONENTS

Component	Use/Function	Operation/Condition/Compatibility
D17, 18	BPF2 switching	Turn ON when received 1.6000~2.9999MHz.
D19, 20	BPF1 switching	Turn ON when received 0.1~1.5999MHz.
D21, 22	Voltage shift	NB1, NB2 switch.
D24, 25	MCF switching	Select between receive & transmit.
D26, 33	Crystal filter switching	Select between receive & transmit.
D27~30	Crystal filter switching	Select between J3E CW mode & H3E.
D31~35	Reverse current protection	
D36	Switching	S-meter time-constant select.
D37	Reverse current protection	SQL.
D38		MUTE.
D39	Surge voltage absorb for relay.	Speaker relay.
D45	Reverse current protection	EXT ALC.
D46	ALC protection	EXT ALC.
D47	Relay terminal protection	
D48~51	Reverse current protection	MIC terminal (8V line).
D52	Crystal filter switching	
D53, 54	CAR switching	Turn ON when, carrier into BM.
D57	Reverse current protection	8T.
D58	Reverse current protection	
D59, 60	H3E CAR switching	Turn ON when H3E transmit. H3E CAR amplifier input.
D64~66	H3E CAR switching	Turn ON when H3E transmit. H3E CAR amplifier output.
D67	1st local switching	TX-RX switching.
D68	2nd local switching	
D69	Reverse current protection	LOW PWR ALC1, 2.
D70	Reverse current protection	MED PWR ALC1, 2.
D71, 72	Reverse current protection	
D73	Voltage regulator	For DC-DC converter.
D74	Voltage regulator	Voltage supply for IC9, 10 (5V).
D75	Reverse current protection	S-meter, antenna current.

VCO (X58-3720-10) CONTROL UNIT

Component	Use/Function	Operation/Condition/Compatibility
Q1	VCO1	71.395~78.295MHz.
Q2	VCO1 switching	Turn ON when VCO1 operates.
Q3	VCO2	78.295~85.295MHz.
Q4	VCO2 switching	Turn ON when VCO2 operates.
Q5	VCO3	85.295~93.295MHz.
Q6	VCO3 switching	Turn ON when VCO3 operates.
Q7	VCO4	93.295~101.295MHz.
Q8	VCO4 switching	Turn ON when VCO4 operates.
Q9	VCO buffer amplifier	71.395~101.295MHz.
D1	VCO1 vari-cap	
D2	VCO1 switching	Turn ON when VCO1 operates.
D3	VCO2 vari-cap	
D4	VCO2 switching	Turn ON when VCO2 operates.
D5	VCO3 vari-cap	
D6	VCO3 switching	Turn ON when VCO3 operates.
D7	VCO4 vari-cap	
D8	VCO4 switching	Turn ON when VCO4 operates.

TKM-707

DESCRIPTION OF COMPONENTS

DC-DC (X59-1110-00) TX-RX UNIT

Component	Use/Function	Operation/Condition/Conpatibility
Q1	Multi-vibrator	Supplies approx. 19kHz square wave.
Q2	Multi-vibrator	
D1	Voltage multiplying current	

VCO1 (X59-3440-00) CONTROL UNIT

Component	Use/Function	Operation/Condition/Conpatibility
Q1	VCO	30~110MHz.
Q2	VCO buffer	

FAN & TEMP PRO (X59-3370-00) FINAL UNIT

Component	Use/Function	Operation/Condition/Compatibility
IC1(1/2)	Temperature protection	"H" level : 7V, temperature of heatsink increase over 90°C.
IC1(2/2)		"H" level : 7V, temperature of heatsink increase over 55°C.
Q1	Switching	Turn ON when IC1(2/2) operates fan starter.

PARTS LIST

CAPACITORS

CC 45 TH 1H 220 J
1 2 3 4 5 6

- 1 = Type ceramic, electrolytic, etc.
2 = Shape round, square, etc.
3 = Temp. coefficient
4 = Voltage rating
5 = Value
6 = Tolerance

• Temperature Coefficient

1st Word	C	L	P	R	S	T	U
Color*	Black	Red	Orange	Yellow	Green	Blue	Violet
ppm/°C	0	-80	-150	-220	-330	-470	-750

• Capacitor value

- 0 1 0 = 1pF
1 0 0 = 10pF
1 0 1 = 100pF
1 0 2 = 1000pF = 0.001μF

1 0 3 = 0.01μF

2 2 0 = 22pF
1st number | Multiplier
2nd number

2nd Word	G	H	J	K	L
ppm/°C	± 30	± 60	± 120	± 250	± 500

Example CC45TH = -470±60 ppm/°C

• Tolerance

Code	C	D	G	J	K	M	X	Z	P	No code
(%)	± 0.25	± 0.5	± 2	± 5	± 10	± 20	+ 40 - 20	+ 80 - 20	+ 100 - 0	10μF-10~+50 4.7μF-10~+75

Code	B	C	D	F	G
(pF)	± 0.1	± 0.25	± 0.5	± 1	± 2

Less than 10 pF

• Rating voltage

2nd word 1st word	A	B	C	D	E	F	G	H	J	K	V
0	1.0	1.25	1.6	2.0	2.5	3.15	4.0	5.0	6.3	8.0	—
1	10	12.5	16	20	25	31.5	40	50	63	80	35
2	100	125	160	200	250	315	400	500	630	800	—
3	1000	1250	1600	2000	2500	3150	4000	5000	6300	8000	—

• Chip capacitors

(EX) CC 7 3 F S L 1 H 0 0 0 J
1 2 3 4 5 6 7
(Chip) (CH, RH, UJ, SL)
(EX) CK 7 3 F F 1 H 0 0 0 Z
1 2 3 4 5 6 7
(Chip) (B, F)

→ Refer to the table above.

Dimension

Dimension code	L	W	T
Empty	5.6 ± 0.5	5.0 ± 0.5	Less than 2.0
E	3.2 ± 0.2	1.6 ± 0.2	Less than 1.25
F	2.0 ± 0.3	1.25 ± 0.2	Less than 1.25

Dimension

Dimension code	L	W	T	Wattage
E	3.2 ± 0.2	1.6 ± 0.2	0.57	2B
F	2.0 ± 0.3	1.25 ± 0.2	0.45	2A

Rating wattage

Cord	Wattage	Cord	Wattage	Cord	Wattage
2A	1/10W	2E	1/4W	3A	1W
2B	1/8W	2H	1/2W	3D	2W
2C	1/6W				

RESISTORS

• Chip resistor (Carbon)

(EX) RD 7 3 E B 2 B 0 0 0 J
1 2 3 4 5 6 7
(Chip) (B, F)

• Carbon resistor (Normal type)

RD 1 4 B B 2 C 0 0 0 J
1 2 3 4 5 6 7

- 1 = Type ceramic, electrolytic, etc.
2 = Shape round, square, etc.
3 = Dimension
4 = Temp. coefficient
5 = Voltage rating
6 = Value
7 = Tolerance.

Rear Panel

ADJUSTMENT

FCC Requirements

The FCC requires that the deviation and frequency of the transceiver be checked annually.

Precautions

The inherent quality of the solid-state components used in this transceiver provides many years of continuous use. Take the following precautions to prevent damage to the transceiver.

- Never key the transmitter unless an antenna or suitable dummy load is connected to the transceiver's antenna receptacle.
- Ensure that the input voltage does not exceed 16V DC or fall below 11V DC.

Test Applications

- Performance test : conducted to check overall transceiver operation. This should be performed before transceiver sale/installation.
- Alignment : conducted if the transceiver fails the performance test or if a critical electrical component has been replaced. KENWOOD recommends that alignment be performed whenever maintenance is performed.

Test Equipment

The following test equipment, or its equivalent, is necessary for TKM-707 maintenance.

Test Equipment Required for Alignment

No.	Test Equipment	Major Specifications
1	Standard Signal Generator (SSG)	Frequency Range Modulation Output 0.5 to 30 MHz. AM or external modulation. 0.1 μ V to greater than 1 mV.
2	Power Meter	Input Impedance Operation Frequency Measurement Capability 50 Ω . 0.5 to 30 MHz or more. Vicinity 200 W.
3	Directional coupler	Operation Frequency 0.5 to 30 MHz.
4	Digital Volt Meter (DVM)	Measuring Range Accuracy 20V DC. High input impedance for minimum circuit loading.
5	Oscilloscope	DC through 30 MHz.
6	High Sensitivity Frequency Counter	Frequency Range Frequency Stability 10 Hz to 100 MHz. 0.2 ppm or less.
7	Ammeter	30A.
8	AF Volt Meter (AF VTVM)	Frequency Range Voltage Range 50 Hz to 10 kHz. 3 mV to 3 V.
9	Audio Generator (AG) QTY : 2	Frequency Range Output 50 Hz to 5 kHz or more. 1 and 1 V.
10	RF Volt Meter (RF VTVM)	Frequency Range Voltage Range Impedance 10 kHz to 500 MHz. 10 mV to 300 V. 1 M Ω and less than 3 pF, min.
11	Voltmeter	Measuring Range Input Impedance 10 to 1.5 V DC or less. 50 k Ω /V or greater.
12	Dummy Load	Approx. 4 Ω , 5 W.
13	Regulated Power Supply	13.6 V approx. 30 A (adjustable from 11 to 16 V). Useful if ammeter equipped.

TKM-707

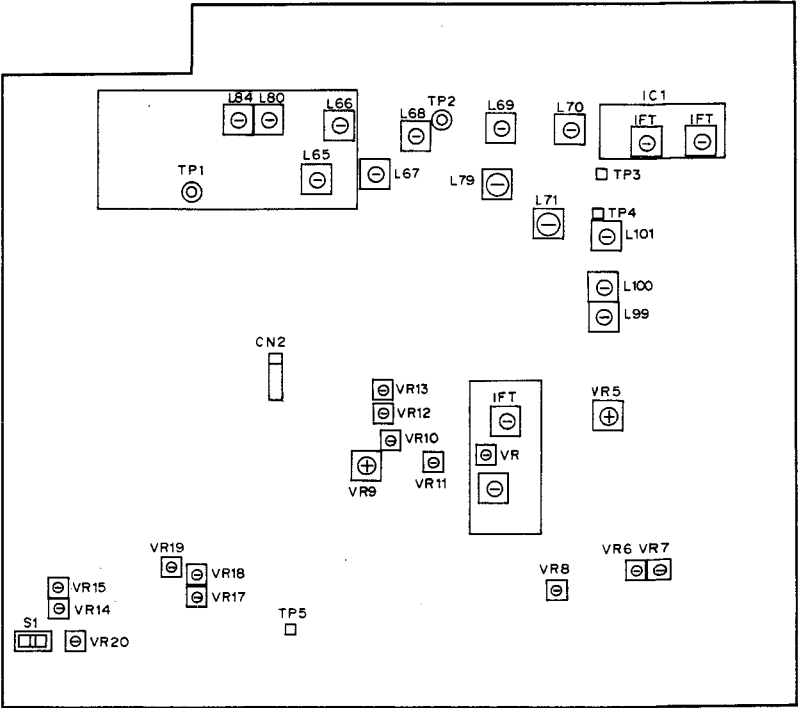

ADJUSTMENT

Alignment

The TKM-707 alignment points are shown in figure.
After connecting test equipment, ensure that the supply voltage is 13.6V.

Top view

TX-RX unit (X57-3470-10)

Bottom view

Control unit (X53-3280-10)

ADJUSTMENT

Preparations

1. Remove the screws from the top and bottom of the case to expose the bottom of the set. (The control unit (x53-3280-10) can be seen.)
2. Check that the POWER switch is set to OFF.
3. Change DIP switch S301's No.1 of the control unit from ON to OFF. (The operation mode changes from the user mode to the dealer mode.)

Indicates the switch setting position (OFF).

4. Set the POWER switch to ON while holding the ENT key down. (Microcomputer reset)
5. Write the receive and transmit frequencies to the memory channel as follows:

Memorize the required receive and transmit frequencies on the memory channel during adjustment. Memorized frequencies and modes are as follows:

2.100.0 MHz USB

4.100.0 MHz USB

Write the memory in the following order:

- 1) Press the MEMO/DIAL key to enter the memory mode.
- 2) Press the ENT key to enter the memory entry mode. A vacant channel display is shown below.

- 3) Rotate the channel selector to select the desired memory channel (vacant channel) on which no frequency has been memorized.

Rotate the channel selector until the desired memory channel appears.

- 4) Enter the receive frequency sequentially from the high-order digit from the numeric keypad. Example: When memorizing 2.100.0 MHz, enter 2, 1, 0, 0, 0 in this sequence.

- 5) Press the MODE key to set the desired USB mode.
- 6) Press the ENT key to store the RX data into the selected memory channel.
- 7) The display panel is shown below.

- 8) Enter the transmit frequency sequentially from the high-order digit from the numeric keypad. Enter the same 2.100.0 MHz frequency as the receive frequency.

- 9) Press the ENT key.

Writing the 2.100.0 MHz frequency and USB mode to a certain memory channel is completed. Write other frequencies and modes to vacant channels in the same way as the above.

ADJUSTMENT

PLL Adjustment

1. PLL C-Loop (carrier) Check and Adjustment

1-1. Voltage-controlled oscillator (VCO) check

1. Connect a digital voltmeter to the TP4 terminal of the control unit.
2. Press the MEMO/DIAL key to enter the memory mode.
3. Turn the channel selector and read the selected 2.100.0 MHz USB.
4. Check that the display frequency is 2.100.0 USB and that the voltage is 3 to 5 V.
5. Set the mode to 2.100.0 LSB with the MODE key. Check that the voltage is 0.3 to 0.5 V lower than the USB voltage.

1-2. Output level adjustment

1. Connect an RF voltmeter to the TP5 terminal of the control unit.
2. Turn L32's core of the control unit in the direction in which it is inserted until the output becomes 0.35 Vrms. (Specification: 0.35 ± 0.03 Vrms)

2. Clarifier Adjustment

1. Set the clarifier control on the front panel to the center click position.
2. Turn VR303 of the control unit until symbol ★ on the LCD display disappears.
3. Check that the same width to center clock position of clarifier control when clarifier control is turned right and left position. (Until symbol ★ on the LCD display disappears.)

3. PLL B-Loop Check

1. Connect a digital voltmeter to the TP2 terminal of the control unit.
2. With the set in the memory mode, press the MEMO/DIAL key to enter the dial mode.
3. Enter 2.100.0 from the numeric keypad, then press the ENT key.
A beep sounds, and the frequency becomes 2.100.0 MHz.
Press the MODE key to enter the USB mode.
4. Check that the voltage at TP2 is 1.5 to 3.0 V.
5. Turn the channel selector until the frequency is 2.099.9 MHz.
6. Check that the voltage at TP2 is 5.5 to 7.0 V.

4. PLL MCF Adjustment

1. Connect an RF voltmeter to the TP3 terminal of the control unit.
2. Alternately turn L25 and L26 of the control unit until they are maximum. (Specification: 30 to 40 mV)

5. PLL A-Loop Check

1. Connect a digital voltmeter to the TP1 terminal of the control unit.
2. Press the MEMO/DIAL key to enter the dial mode.
3. Enter 22.000.0 MHz from the numeric keypad, then press the ENT key.
Press the MODE key to enter the USB mode.
4. Check that the voltage at TP1 is 1.5 to 2.5V.
If the voltage at TP1 is unable to 1.5 to 2.5V, adjustment are as follows :
Enter 29.999.9 MHz from the numeric keypad, then press the ENT key.
Press the MODE key to enter the USB mode.
Turn TC4 of the X58-3720-10 in the control unit until the voltage is 6.5 ± 0.1 V.
5. Enter 14.000.0 MHz from the numeric keypad, then press the ENT key.
Press the MODE key to enter the USB mode.
6. Check that the voltage at TP1 is 1.5 to 2.5V.
If the voltage at TP1 is unable to 1.5 to 2.5V, adjustment are as follows :
Enter 21.999.9 MHz from the numeric keypad, then press the ENT key.
Press the MODE key to enter the USB mode.
Turn TC3 of the X58-3720-10 in the control unit until the voltage is 6.5 ± 0.1 V.
7. Enter 7.000.0 MHz from the numeric keypad, then press the ENT key.
Press the MODE key to enter the USB mode.
8. Check that the voltage at TP1 is 1.5 to 2.5V.
If the voltage at TP1 is unable to 1.5 to 2.5V, adjustment are as follows :
Enter 13.999.9 MHz from the numeric keypad, then press the ENT key.
Press the MODE key to enter the USB mode.
Turn TC2 of the X58-3720-10 in the control unit until the voltage is 6.5 ± 0.1 V.
9. Enter 0.100.0 MHz from the numeric keypad, then press the ENT key.
Press the MODE key to enter the USB mode.

ADJUSTMENT

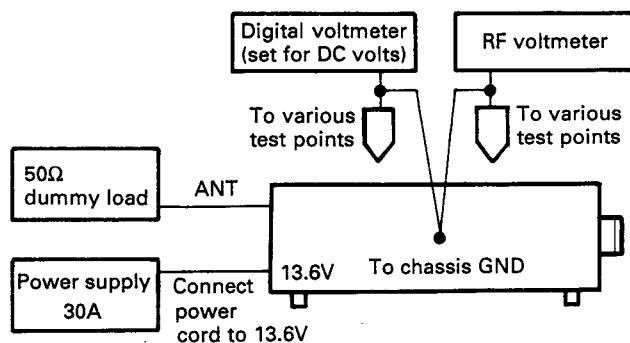

10. Check that the voltage at TP1 is 1.5 to 2.5V.

If the voltage at TP1 is unable to 1.5 to 2.5V, adjustment are as follows :

Enter 6.999.9 MHz from the numeric keypad, then press the ENT key.

Press the MODE key to enter the USB mode.

Turn TC1 of the X58-3720-10 in the control unit until the voltage is $6.5 \pm 0.1V$.

Receiver Adjustment

1. Second HET Adjustment (HET2: 60.6 MHz)

1. Connect an RF voltmeter to the TP4 terminal of the TX-RX unit.
2. Set that the memorizing frequency is 2.100.0 MHz, the mode is USB.
3. Turn L101 of the TX-RX unit until the peak level is 0.45 to 0.65 Vrms.

2. Reference Frequency Check

1. Connect a frequency counter to the TP4 terminal of the TX-RX unit.
2. Check that the frequency is within 60.600.0 MHz \pm 10 Hz.

Note : Adjust the frequency when the frequency counter power switch is turned on after warm-up 10 minutes later.

3. MCF Adjustment

1. Connect a tracking generator to the TP1 terminal of the TX-RX unit.
2. Connect a spectrum analyzer to the TP2 terminal of the TX-RX unit.
3. Remove coaxial cable connector CN2 (HET) from the TX-RX unit.

Spectrum analyzer specifications:

Center frequency 71.295 MHz

Span 50 kHz

Reference level -30 dBm

TG level -20 dBm, 2 dB/div

4. Adjust the waveforms and gain in the order of L65, L68, L67, and L66 of the TX-RX unit.
Set the L66's core always inside.

ADJUSTMENT

4. Receiving Amplifier Adjustment

1. Connect SSG to the ANT terminal.
2. Connect an AF voltmeter, an oscilloscope, and a 4Ω dummy load to the EXT. SP terminal.

SSG specifications:

Receiving frequency	2.101.0 MHz
Level	-113 dBm (0.5 μV)
Mode	CW

3. Set that the memorizing frequency is 2.100.0 MHz, the mode is USB.
4. Turn the two IFTs of the TX-RX unit IC2, and turn L69, L70, and L71 of the TX-RX unit until the AF output is maximum.

5. S-meter Adjustment

1. Connect SSG to the ANT terminal.
2. Connect a digital voltmeter to the TP5 terminal of the TX-RX unit.

SSG specifications:

Receiving frequency	2.101.0 MHz
Level	RF OUT OFF
Mode	CW

3. Set that the memorizing frequency is 2.100.0 MHz, the mode is USB.

5-1. S-meter zero-point adjustment (S-0)

1. Turn VR3 of the TX-RX unit until the voltage at the TP5 terminal is 0.1 V (Specification: 0.1 V ± 0.02 V)

5-2. S-meter eight-point adjustment (S-8)

SSG specifications:

Receiving frequency	2.101.0 MHz
Level	-73 dBm (50 μV)

1. Set that the memorizing frequency is 2.100.0 MHz, the mode is USB.
2. Turn VR4 of the TX-RX unit until the LCD on the panel indicates that a "9-point bar indicator" goes off.

5-3. S-meter one-point adjustment (S-1)

SSG specifications:

Receiving frequency	2.101.0 MHz
Level	-103 dBm (1.58 μV)

1. Set that the memorizing frequency is 2.100.0 MHz, the mode is USB.
2. Turn the VR control of the TX-RX unit IC2 until the LCD on the panel indicates that a "1-point bar indicator" goes on.

5-4. Zero- and eight-point checks

1. Set that the memorizing frequency is 2.100.0 MHz, the mode is USB, and the SSG frequency is 2.101.0 MHz.

• SSG level: RF OUT OFF

1. Check that the voltage at the TP5 terminal of the TX-RX unit is 0.08 to 0.15 V.

• SSG level: -73 dBm (50 μV)

1. Check that the LCD on the panel indicates a "8-point bar" indicator goes on.

Note: If the checks in steps 5-4 are incorrect, make the adjustments outlined in steps 5-1 through 5-3 again.

6. NB Adjustment

1. Connect SSG to the ANT terminal.
2. Connect an analog voltmeter to the TP3 terminal of the TX-RX unit.

SSG specifications:

Frequency	2.101.0 MHz
Level	-93 dBm (5 μV)

Set that the memorizing frequency is 2.100.0 MHz and that the mode is USB.

3. Turn the two IFTs of the TX-RX unit IC1 until the voltage at the TP3 terminal is minimum. (Reference level: Approx. 3.25V)

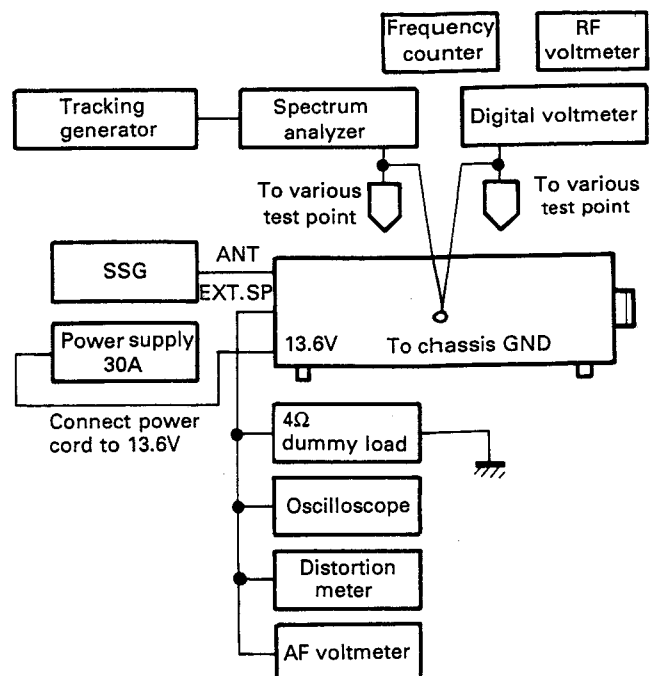

4. SSG specifications:

Frequency	2.101.0 MHz
Level	RF OUT OFF

Check that the voltage at the TP3 terminal of the TX-RX unit increases approximately 5.45 V.

7. Squelch Adjustment

1. Set that the receiving frequency is free and that the mode is USB.
2. Turn VR5 of the TX-RX unit counterclockwise as far as it will go. (Preset)
3. Set the SQL switch on the front panel to ON, then slowly turn VR5 until it is set to the threshold position.

ADJUSTMENT

Transmitter Adjustment

1. Setting

1. Remove the coaxial plug (DO) of the TX-RX unit from the printed circuit board, then connect a RF voltmeter to the coaxial plug.

2. Set VR10 of the TX-RX unit to the center position.
3. Press the 2182 key to select the desired emergency channel (2.182.0 MHz), and press the MODE key to enter the H3E mode.
4. Insert a MIC or STBY switch into the microphone connector, then place the set in the transmit mode.
5. Turn L79, L80, and L84 of the TX-RX unit until the RF voltmeter (50Ω terminated) reading is maximum. (Specification: 0.5 Vrms or more.)

2. Carrier Level Adjustment

1. Connect the control cable of the antenna coupler MAT-100.
2. Connect an RF voltmeter to the DO terminal of the TX-RX unit as described in step 1.
Set that the memorizing frequency is 2.100.0 MHz and that the mode is USB.
Press the TUNE key to enter the transmit mode.
3. Turn VR10 of the TX-RX unit until the RF voltmeter reading is 8 dBm. (Specification: 8 ± 0.5 dBm)
Return to receive mode automatically after transmitting 15 seconds.

Note: After adjustment is completed, remove the coaxial plug (DO) of the TX-RX unit from the RF voltmeter, then insert the coaxial plug into the coaxial socket on the printed circuit board.

3. Transmission Output Adjustment

1. Connect a power meter to the ANT terminal.
2. Connect the two audio generator to the microphone connector. Also, connect an AF voltmeter to check the AG output.
AG1 specifications:
Frequency 400Hz
Level 50 mV
AG2 specifications:
Frequency 1800 Hz
Level 50mV
3. Set that the memorizing frequency is 2.100.0 MHz and that the mode is USB.

3-1. High Power Adjustment

1. Place the set in the transmit mode.
2. Turn VR14 of the TX-RX unit until the power is 75 W. (Specification: 75 ± 5 W)
3. After adjustment is completed, return the set to the receive mode.

3-2. MED Power Adjustment

1. Press the FUNC and 5 keys sequentially, then set the power medium (during reception).
2. Place the set in the transmit mode.
3. Turn VR17 of the TX-RX unit until the power is 40 W. (Specification: 40 ± 5 W)
4. After adjustment is completed, return the set to the receive mode.

3-3. Low Power Adjustment

1. Press the FUNC and 6 keys sequentially, then set the power low (during reception).
2. Place the set in the transmit mode.
3. Turn VR18 of the TX-RX unit until the power is 20 W. (Specification: 20 ± 3 W)
4. After adjustment is completed, return the set to the receive mode.
5. Press the FUNC and 4 keys sequentially, then return the power from low to high.

4. MIC Sensitivity Adjustment

1. Connect a power meter to the ANT terminal.
2. Connect an AG to the microphone connector, then connect an AF voltmeter to check the AG output.
AG specifications:
Frequency 1 kHz
Level 5 mV
3. Set that the memorizing frequency is 2.100.0 MHz and that the mode is USB.
4. Place the set in the transmit mode.
5. Turn VR9 of the TX-RX unit until the power is 50 W. (Specification: 50 ± 5 W)
6. Return the set to the receive mode.

ADJUSTMENT

5. Transmitting Meter Adjustment

1. Make the adjustments outlined in steps 4-1 through 4-4 above. Except AG frequency : 1 kHz, level : 50 mV.
2. Check that the S1's switch position is INT side of the TX-RX unit. If S1 is unable to INT position, change S1's position to INT.
3. Place the set in the transmit mode.
4. Turn VR20 of the TX-RX unit until the LCD transmitting meter reads that a "8-point bar indicator" goes on.
5. Return the set to the receive mode.
6. Replace the S1's position after adjusted.

6. H3E Carrier Level Adjustment

1. Connect a power meter to the ANT terminal.
2. Press the 2182 key to select the desired emergency channel (2.182.0 MHz), and press the MODE key to enter the H3E mode.
3. Place the set in the transmit mode.
4. Turn VR11 of the TX-RX unit until the power is 45 W. (Specification: $45W \pm 5 W$)

7. Protection Adjustment

1. Connect a DC ammeter (30 A range) in series to the (+) DC line.
2. Strap the ANT terminal with a check jig.
3. Connect an audio generator to the microphone connector. Also, connect an AF voltmeter to check the AG output.
AG specifications:
Frequency 1 kHz
Level 50 mV
4. Set that the memorizing frequency is 4.100.0 MHz and that the mode is USB.
5. Place the set in the transmit mode.
6. Turn VR15 of the TX-RX unit until the ammeter reading is 16 A. (Specification: $16 \pm 0.5 A$)
7. After adjustment is completed, return the set to the receive mode.

8. Carrier Suppression Adjustment

1. Connect a power meter to the ANT terminal via a directional coupler.
2. Connect a spectrum analyzer to one side of the directional coupler.
3. Set that the memorizing frequency is 2.100.0 MHz and that the mode is USB.
4. Place the set in the transmit mode.
5. Turn VR12 and VR13 of the TX-RX unit until the spectrum analyzer reading is minimum.
Specification: 60 dB-lower than full power in the USB mode (MIC input frequency : 1 kHz, level : 50 mV)
6. Return the set to the receive mode.

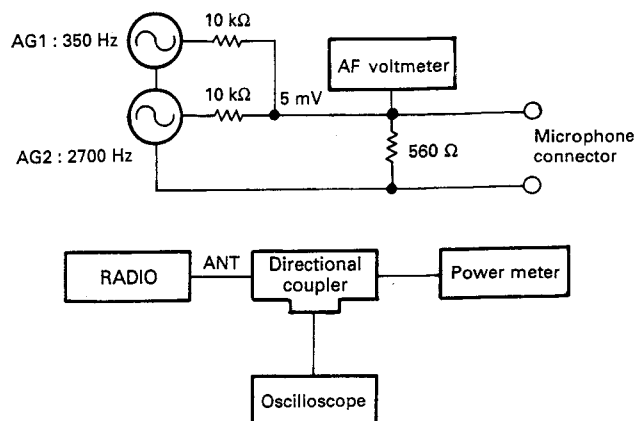

9. Transmitting Frequency Characteristic Adjustment

1. Connect a power meter to the ANT terminal via a directional coupler.
2. Connect an oscilloscope to one side of the directional coupler.
3. Connect the two audio generators to Microphone connector. Also, connect an AF voltmeter to check the AG output.
AG specifications:
AG1 frequency 350 Hz
Output 5 mV
AG2 frequency 2700 Hz
Output 5 mV
4. Set that the memorizing frequency is 2.100.0 MHz and that the mode is USB.
5. Place the set in the transmit mode.
6. Turn VR301 of the control unit until the waveform is crossed.

ADJUSTMENT

7. Press the MODE key to enter the LSB mode.
8. Check that the transmitting frequency is 2.100.0 MHz and that the mode is LSB.
9. Place the set in the transmit mode.
10. Turn VR302 of the control unit until the waveform is crossed.
11. Return the set to the receive mode.

10. Alarm Tone Adjustment

1. Remove the coaxial plug (DO) of the TX-RX unit from the printed circuit board, then connect an RF voltmeter to the coaxial plug.
2. Press the ALARM and 2182 keys at the same time.
3. Turn VR8 of the TX-RX unit until the RF voltmeter reading is 8 dBm. (Specification: 8 ± 0.5 dBm)
4. Press the 2182 key to stop the tone, and transmit mode.

Note: After adjustment is completed, remove the coaxial plug (DO) of the TX-RX unit from the RF voltmeter, then insert the coaxial plug into the coaxial socket on the printed circuit board.

11. Tuning Power Adjustment

1. Connect a power meter to the ANT terminal.
2. Connect the control cable of the antenna coupler MAT-100 (rear panel).
3. Press the MEMO/DIAL key to enter the memory mode.
4. Set that the memorizing frequency is 2.100.0 MHz and that the mode is USB.
5. Press the TONE key to place the set in the transmit mode.
6. Turn VR19 of the TX-RX unit until the power is 10 W. (Specification: 10 ± 1 W)
7. Return to receive mode automatically after transmitting 15 seconds.

12. After adjustment is completed, perform the following:

• Erase the memorized frequencies and modes

Only the transmitting/receiving frequencies below those memorized for adjustment must be erased.
2.100.0 USB, 4.100.0 USB

1. Press the MEMO/DIAL key to enter the memory mode.
2. Press the ENT key to select the memory entry mode.
3. Turn the encoder and set it to the memory channel to be erased.
4. Press the O key.
5. Press the ENT key.

The frequencies and modes of the memory channel that was used for adjustment are then erased.

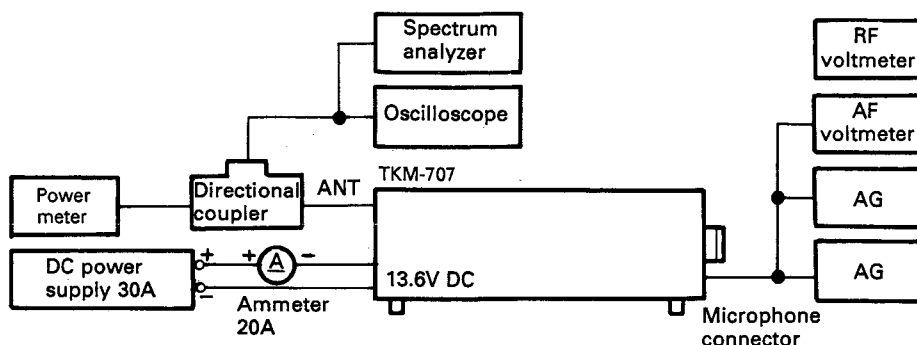

Note: Return the DIP switch S301 to original position (before factory setup position).

Destined for USA

No.1 : OFF, No.2 to 4 : ON

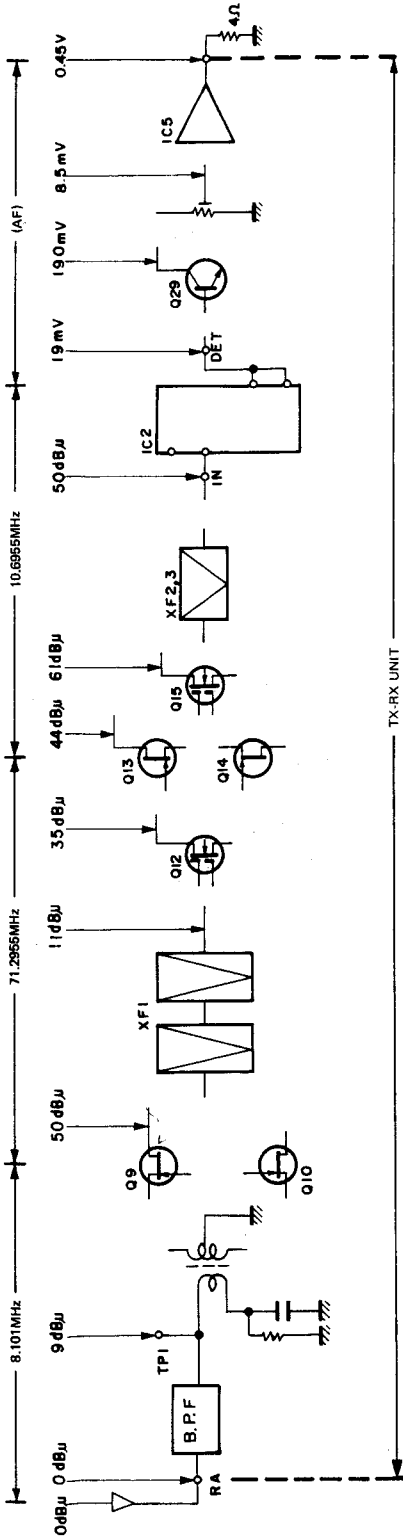

Destined for other countries

No.1 to 3 : ON, No.4 : OFF

LEVEL DIAGRAM

Receiver section

Freq : 8.100MHz
Mode : J3E USB
SSG out : 0dBμ
AF out : 0.45V/8Ω

- 1. These SSG signal level values are necessary in order to obtain the same level of audio output (with the AF VR fixed) when 0.45V/8Ω audio signals are obtained (using the AF GAIN VR) from 8.100MHz, 0dBμ signal input from antenna.
- 2. SSG output was measured, using a 0.01μF capacitor for RF and IF circuit.
- 3. SSG output was measured, using a 10μF electrolytic capacitor for AF circuit.

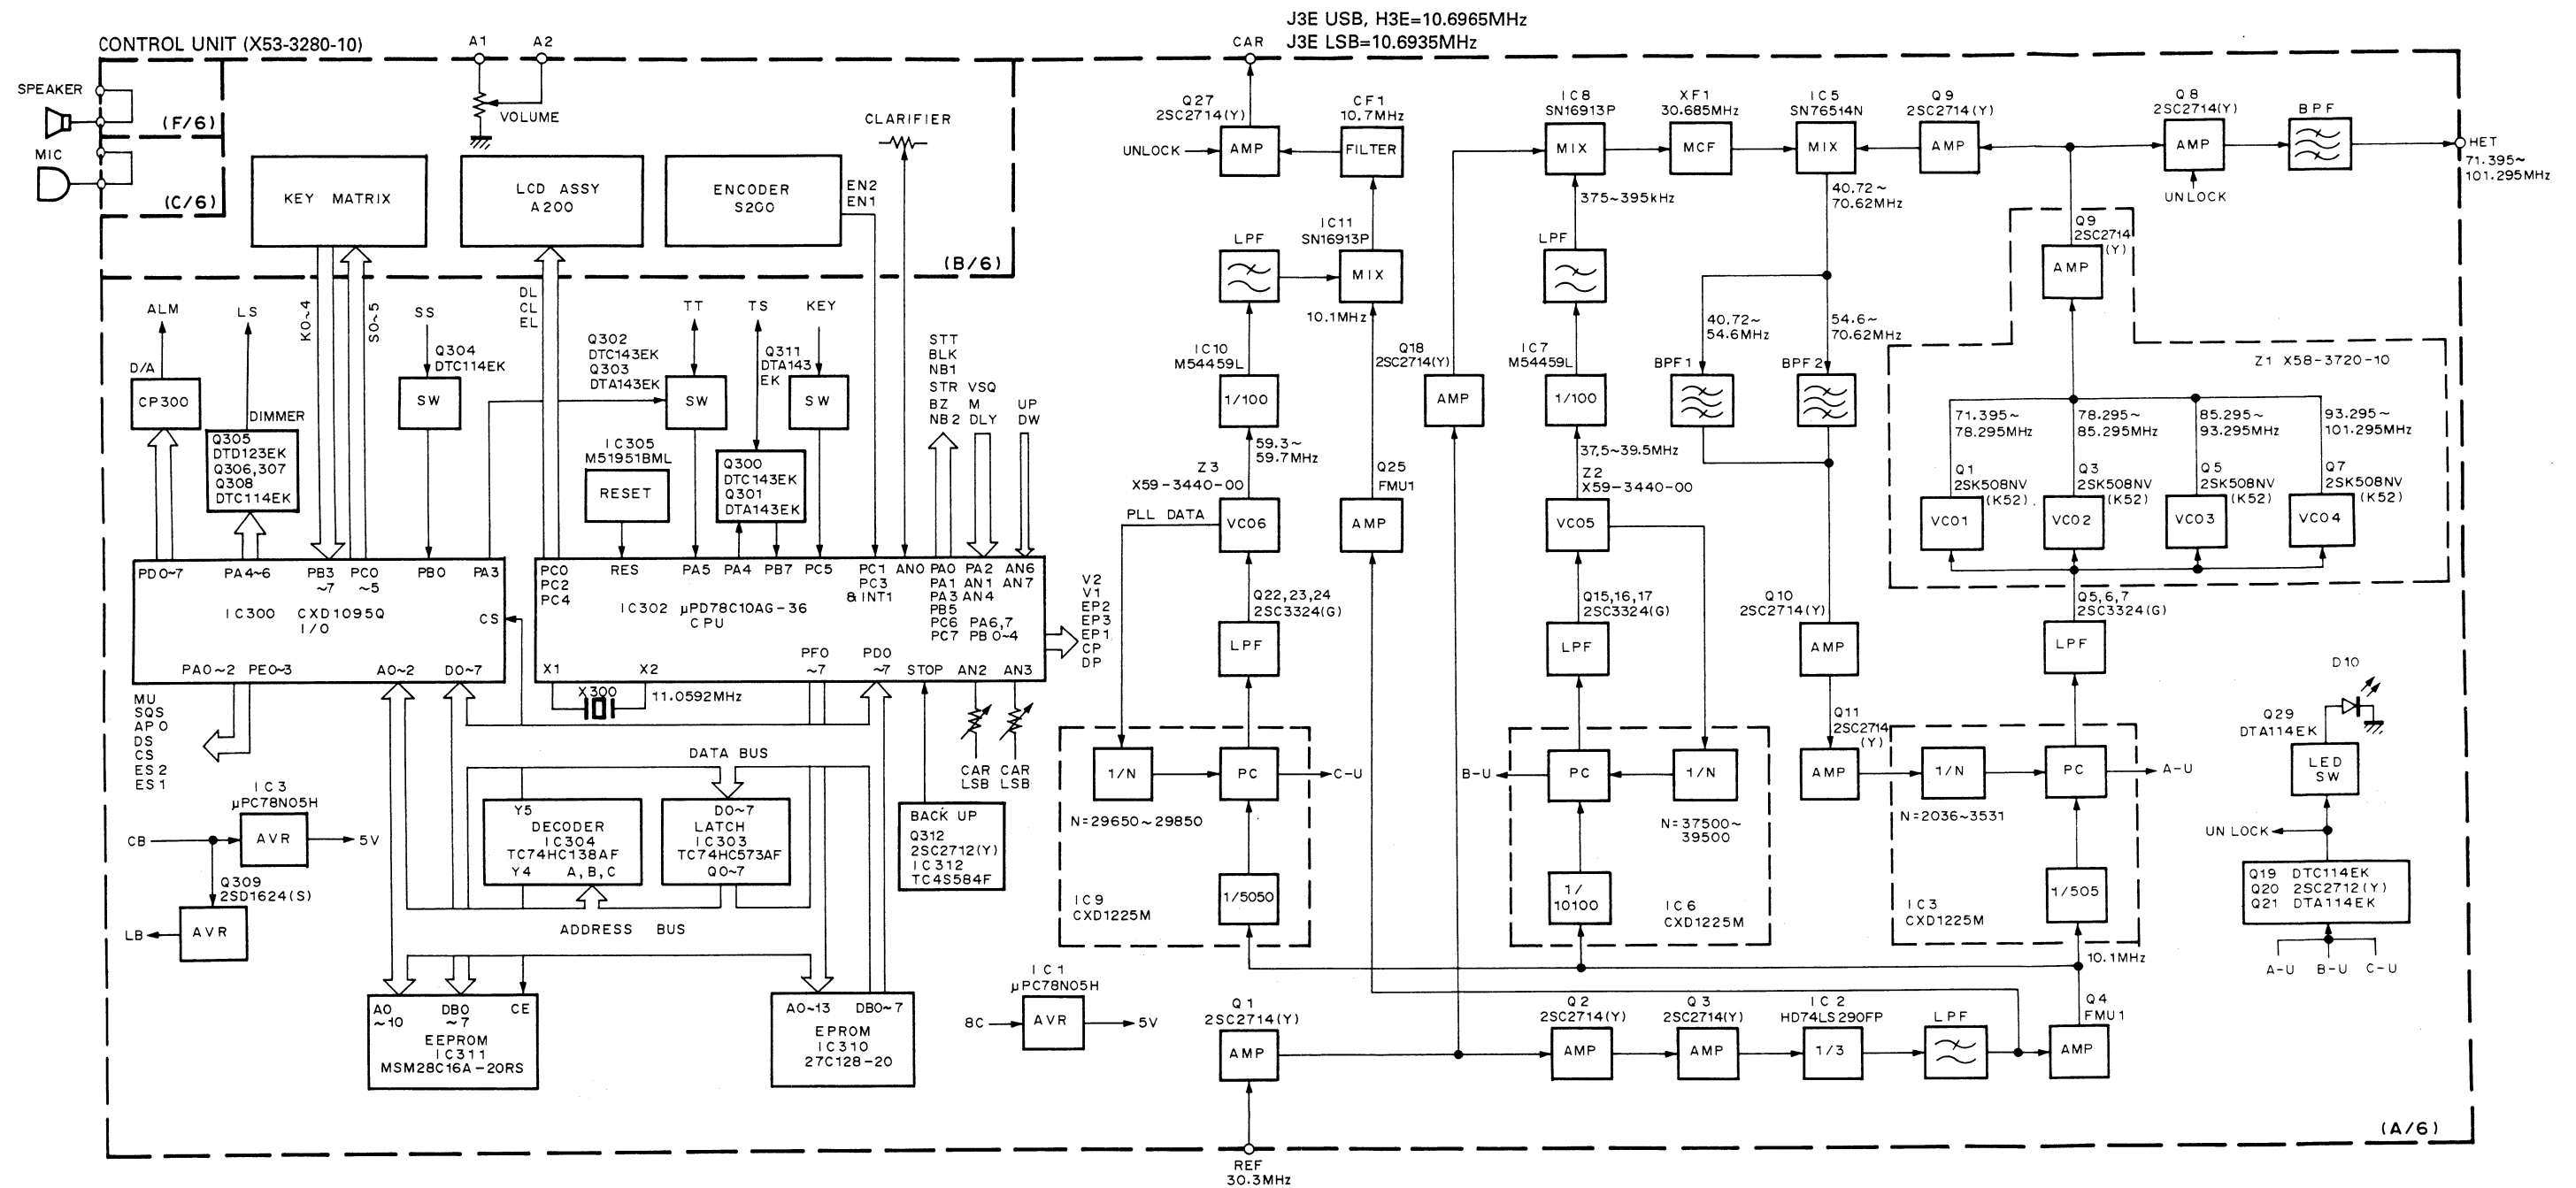

Transmitter section

- 1. Freq. : 2.200MHz
- 2. Mode : J3E USB
- 3. The high frequency circuits measured with a power meter in USB mode. (50Ω terminated to DO terminal on the TX-RX unit)
- 4. The audio input voltages are necessary to that output almost reaches saturation (AG : 1kHz 5mV single tone).

FINAL UNIT

A diagram of a 3-pin connector. It consists of a rectangular block with a circular feature on the left side. Three pins extend from the right side of the block. The pins are labeled from top to bottom: C, E, and B.

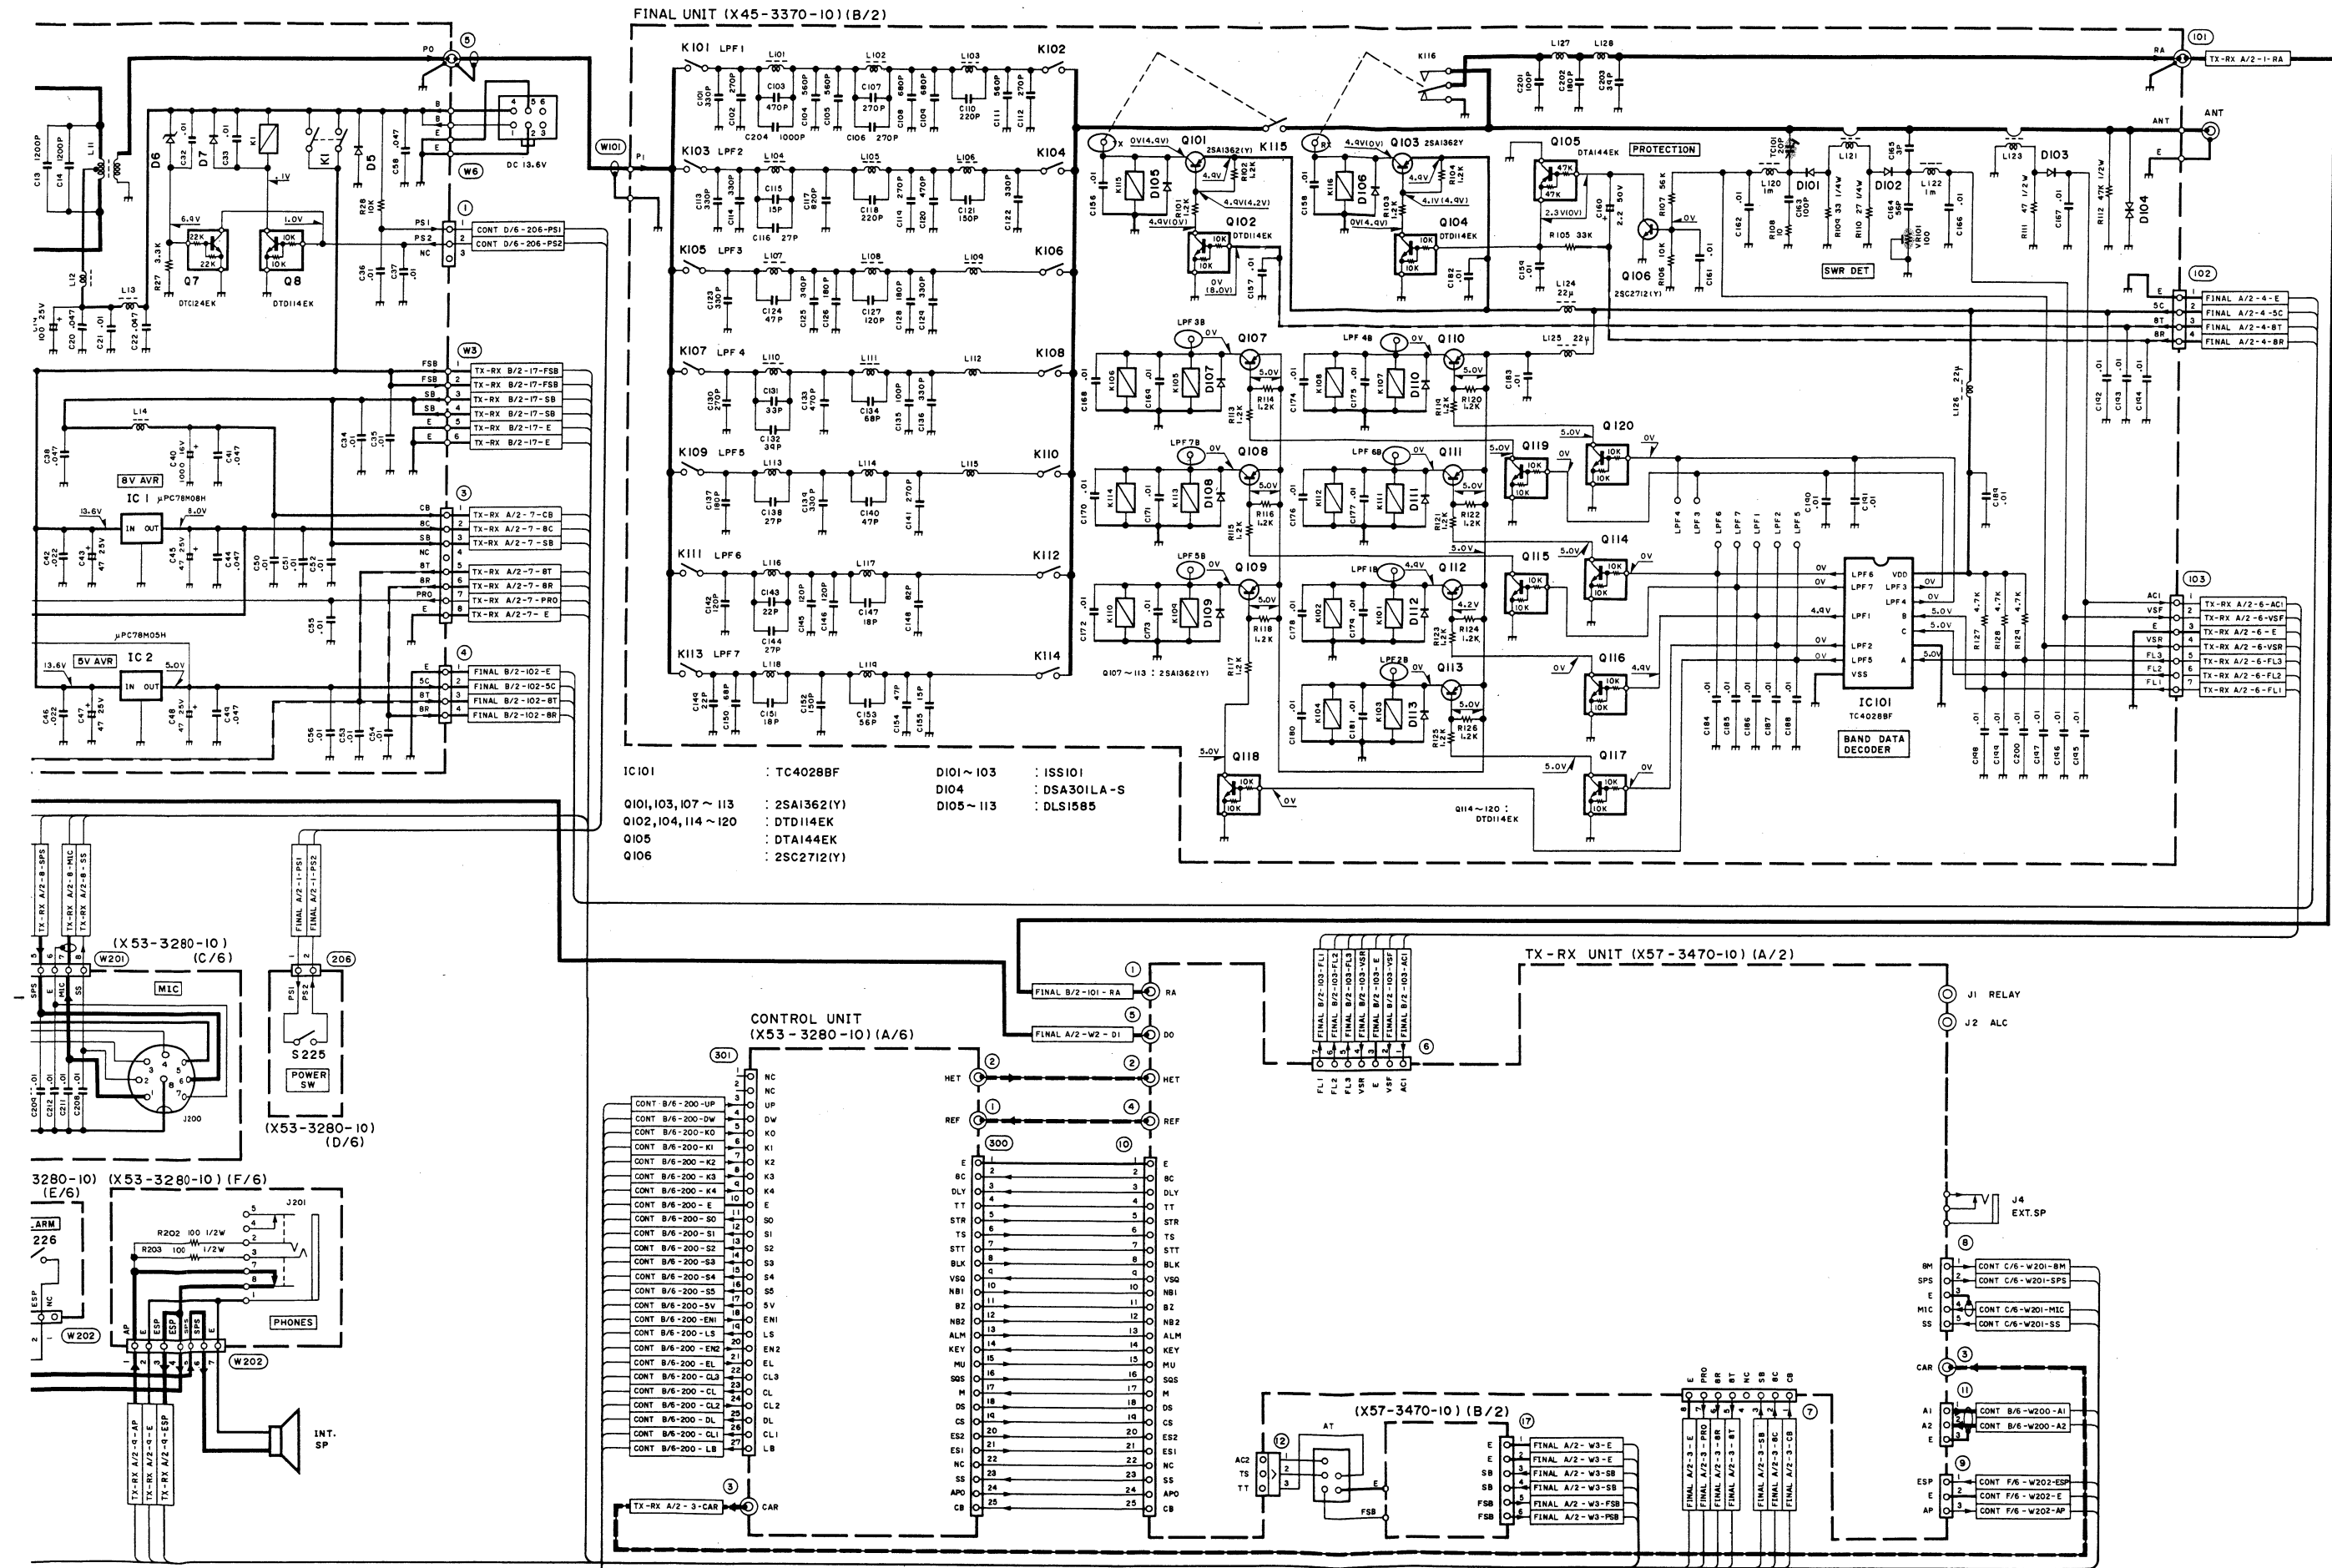

A diagram of a 3-pin DIN connector. The connector is shown in perspective, with three pins extending from the front. The pins are labeled B, C, and E from left to right. Pin B is the shortest, pin C is of medium length, and pin E is the longest.

Diagram of the output connector showing four pins labeled OUTPUT, GND, INPUT, and (Case).

A perspective view of a 16-pin DIP package. The package is rectangular with two rows of pins. The pins are numbered: 1 at the bottom center, 8 at the bottom right, 9 at the top right, and 16 at the top left. The package has a notch on the left side.

SCHEMATIC DIAGRAM TKM-707

Circuit Description

• Tuning

The MAT-100 is a high-frequency band automatic antenna tuner that can be remotely controlled. When tuning with a remote controller, the TS terminal of the control cable goes low and a tuning start signal is sent. When the MAT-100 detects that the TS terminal is low, the CPU is reset in order to start tuning. A tuning signal is sent from the remote controller to the sensor circuit of the MAT-100.

The sensor circuit detects the frequency count, forward voltage, reflected voltage, impedance, and phase voltage and sends the data to the CPU. The CPU then activates a tuning circuit relay to enter the tuning state. An LED indicator goes on to indicate the relay operation status. When tuning starts, the CPU memorizes the tuning state. When tuning with the same frequency, the current data is used and the tuning state is entered.

When tuning is completed, the TT terminal is set to high to send a termination signal. When the MAT-100 detects the termination signal, the STBY signal goes low to return the TS signal to high. The standby mode is then entered to stop the clock.

When DIP switch S4 of the LED unit (W02-0883-08) is set to MANUAL, tuning can be performed manually. The relay switch can be controlled with switches S1 through S3.

• Through mode

The MAT-100 can be set in the through mode in which an antenna and the remote controller are directly connected. In this case, the TT terminal of the remote controller goes low. The MAT-100 detects that the TT terminal is low. The CPU sets a relay through mode. When mode setting is completed, the CPU enters the standby mode.

• Tuning test

The MAT-100 has a TUNING START switch to test tuning or adjust an antenna. To test tuning, the MAT-100 must be connected to a remote controller with the POWER switch ON. When push-button switch S1 of the MAT-100 is pressed, tuning starts. Push-button switch S1 sets the TS terminal low and sends a tuning start command to the remote controller. When a tune signal is sent from the remote controller, the MAT-100 starts tuning. When tuning is performed normally, the test operation is completed.

Note : When tuning cannot be performed within 15 seconds, a tuning termination command is issued by the remote controller.

• Interface

Control signals are sent and received between the MAT-100 and remote controller using the TS and TT terminals. The TS and TT terminals are bi-directional signal lines.

1. Normal tuning

When the tuning state is set with a remote controller, the TS signal of the remote controller is set low (usually set to high). When the MAT-100 detects that the TS signal is low, the CPU clock is activated to reset the system. At this time, the CPU is activated to check the TS and TT signal status. The CPU sets the TT signal low and reports tuning start. When the TT signal goes low, the remote controller issues a tuning signal. When the MAT-100 completes tuning, the TT signal is returned to high to indicate completion. The tuning signal from the remote controller stops. The TS signal is set to high to complete the tuning. When the TS signal is set to high, the MAT-100 enters the standby mode and stops the clock operation.

2. Abnormal tuning

The remote controller counts for 15 seconds after the TS signal is set low and the TT signal is set to high. If the TT signal is not set low before the count is completed, the MAT-100 judges that tuning can not be performed normally. The remote controller then sets the TS signal to high and reports a tuning interruption. When the TS signal is set to high, the MAT-100's CPU returns the TT signal to high to stop tuning. The MAT-100 then enters the standby mode.

3. Through operation

When the TT signal from the remote controller is set low, a through operation is performed. The MAT-100 activates the CPU and sets the TS signal low. The remote controller then returns the TT signal to high. When tuning is completed, the MAT-100 returns the TS signal to high and sets the CPU in the standby mode to complete the through operation.

For tuning

For abnormal tuning

For through operation

Fig. 1 Interface timing chart

• Manual Tuning

The MAT-100 can set the manual tuning. For manually tuning, change DIP switch S4 of the LED unit from AUTO to MANUAL. When DIP switch S4 is set to MANUAL, relays K1 and K2 are selected so that a sensor circuit is through-connected. LED indicator D48 goes on to indicate tuning completion.

When DIP switches S1 through S3 are selected, relays K1 and K2 are set on or off. The status of S1 through S3 is sent to IC10 through IC13 of the MAT-100 to drive the relays. Table 1 gives the relationships between the DIP switch settings and operation of the relays.

• Control cable terminals

- +13.6 V MAT-100's +13.6 V DC
- GND Ground
- TS Bidirectional control terminal that controls tuning start and completion via a remote controller and reports through start and completion via the MAT-100.
- TT Bidirectional control terminal that controls through start and completion via a remote controller and controls tuning start and completion via the MAT-100.
- GND Ground
- ANT.C Determines the antenna current via the MAT-100 and sends it to the remote controller.

• Tuning Circuit Selection

The tuning circuit is used as a PI matching circuit by connecting jumpers J5 and J6. When the tuning circuit is not matched using a PI match, remove the PI circuit and use an L-type matching circuit. The PI circuit is normally used.

Fig. 2 Control cable connection

- Sensor block**

An attenuator consisting of R1 through R7 is inserted into the sensor to stabilize impedance and reduce unwanted waves during tuning. High power signals are input from the remote controller to the J1 terminal and passed through this attenuator.

The high power signal is tapped off from the main signal and passed through R11 to the frequency read block.

The forward wave and reflected wave signals of the HF signal are detected by a coupler consisting of L12, L13, R9, and R10; converted into a control voltage using D1 and D2; then sent to the analog-to-digital converter.

The converted digital signal is used as an input signal for the input power check and reflection coefficient operation.

The forward and reflected waves are sent through buffers Q1 and Q2 to a DBM consisting of L16, L17, and D47 and sent to comparator IC15 (1/2) as impedance signal IZI. Impedance signal IZI is compared with a 50-ohm impedance.

Voltage and current signals are sent to a DBM consisting of L14, L15, and D46; compared with each other, then extracted as a phase signal.

Input power level range : 8~15 W

- 1. Overpower**

When power exceeding approximately 20 W is detected during the power check, a 100 ms counter is set. When a tuning start (TS) is canceled after 100 ms or within 100 ms, the through mode is entered.

1 : Power check
2 : TS check
3 : Returned to 1 if within 100 ms

* If the power is proper in step 1, stop the above operation and proceed to the next operation.

MAT-100 (AUTOMATIC ANTENNA TUNER)

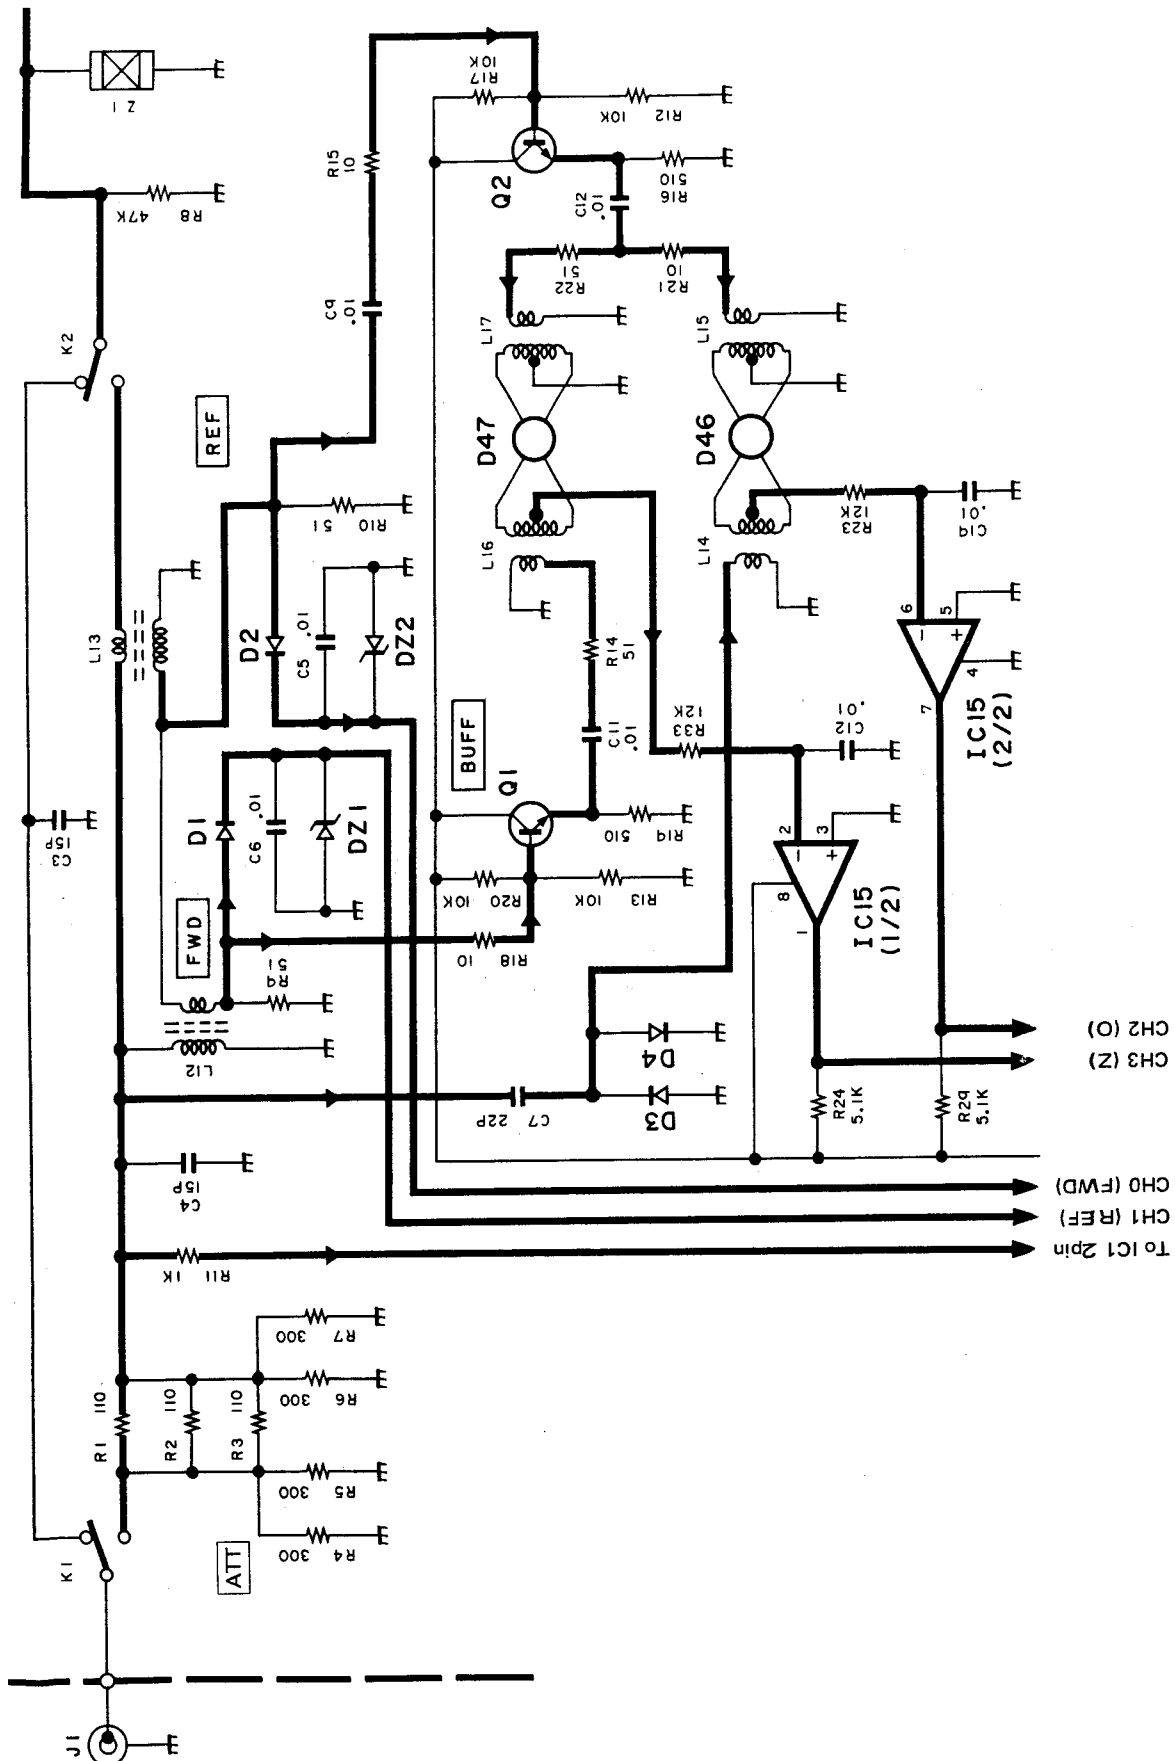

Fig. 3 Sensor circuit (Forward and reflected waves)

TKM-707

MAT-100 (AUTOMATIC ANTENNA TUNER)

• Frequency read block

The HF signal obtained by the sensor circuit is passed through a limiter consisting of C18, C21, D6, and D7, then sent to frequency divider IC1 (1/16) (μ PB553AC). The output level of IC1 is ECL level, so it is converted to TTL level by buffer amplifier Q9, then fed to counter IC2.

The CPU controls the counter at the timing shown in the Figure 4. The counter is cleared with a reset signal, a pulse of this duration is counted with a gate signal, and the count value is latched with a load signal. Meanwhile, data is sent from terminals 1 through 4. For terminals 10^0 , 10^1 , 10^2 , and 10^3 , a digit signal to indicate the data digit is output in an internal free-running period of approximately 700 Hz. IC3 is used to

control the bus line output. When an OE terminal is high, data is output to the bus line.

The above operation is performed only once during tuning start.

MAT-100 (AUTOMATIC ANTENNA TUNER)

• A/D converter

The forward wave, reflected wave, phase, and impedance $|Z|$ voltages obtained by the sensor circuit are

input to IC4. The CPU converts the signal voltage to an 8-bit digital signal and loads it, as required.

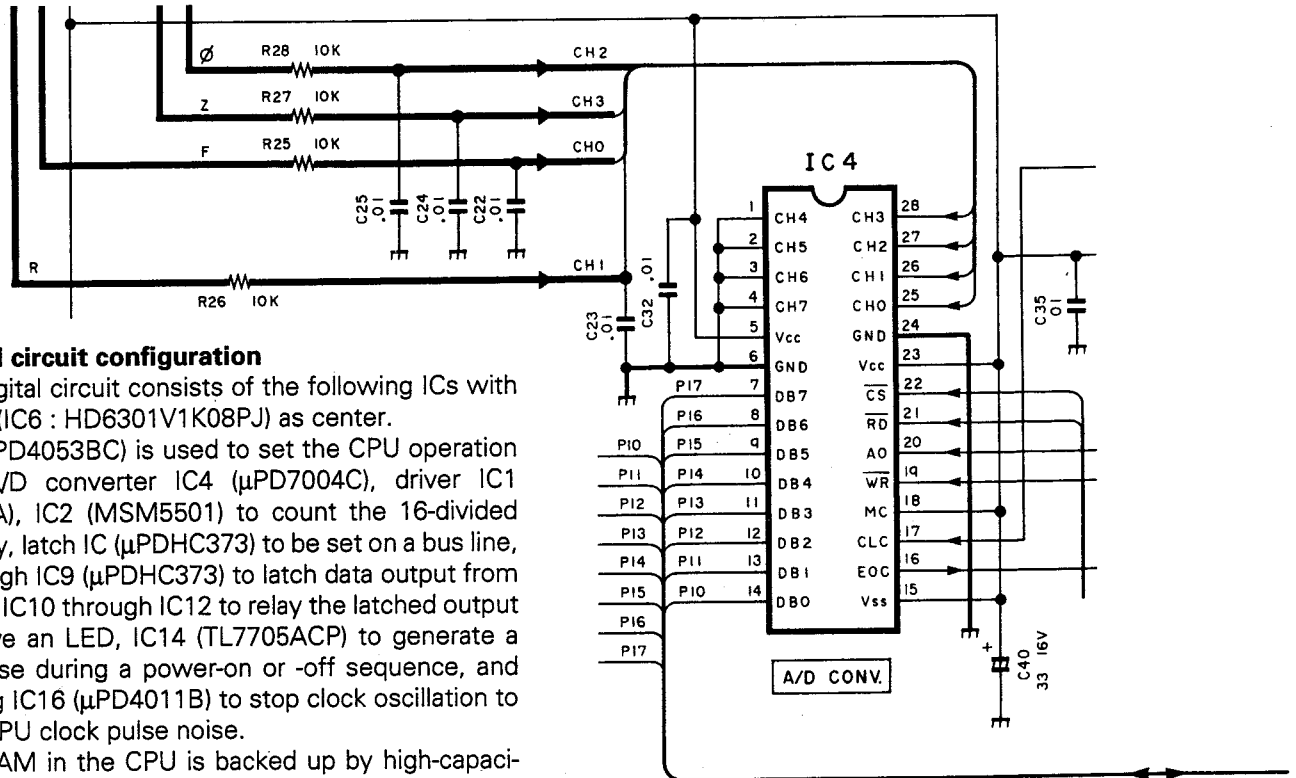

Fig. 6 A/D converter circuit

• Digital circuit configuration

The digital circuit consists of the following ICs with the CPU (IC6 : HD6301V1K08PJ) as center.

IC5 (μ PD4053BC) is used to set the CPU operation mode, A/D converter IC4 (μ PD7004C), driver IC1 (μ PB553A), IC2 (MSM5501) to count the 16-divided frequency, latch IC (μ PDHC373) to be set on a bus line, IC7 through IC9 (μ PDHC373) to latch data output from the CPU, IC10 through IC12 to relay the latched output or to drive an LED, IC14 (TL7705ACP) to generate a reset pulse during a power-on or -off sequence, and switching IC16 (μ PD4011B) to stop clock oscillation to reduce CPU clock pulse noise.

The RAM in the CPU is backed up by high-capacitance capacitor C39 (0.22 F) to retain the memory data items.

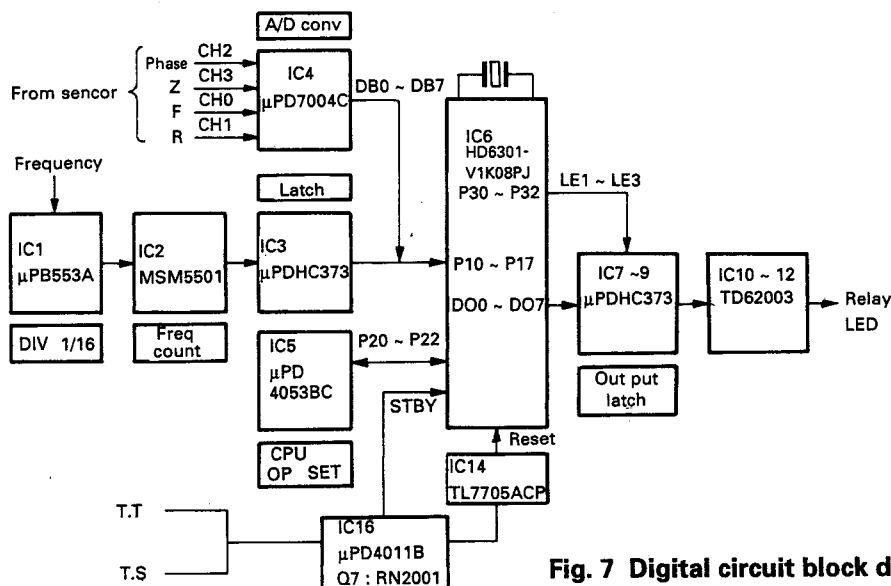

Fig. 7 Digital circuit block diagram

• Output block

Data processed by the CPU is output in 8-bit units, added to a latch pulse sequentially from IC7, then sent to IC9. A relay or LED is then driven by drivers IC10 through IC13.

When output enable circuits IC7 through IC9 are controlled, the relay circuit is manually activated and surge current is reduced during the power-on sequence.

MAT-100 (AUTOMATIC ANTENNA TUNER)

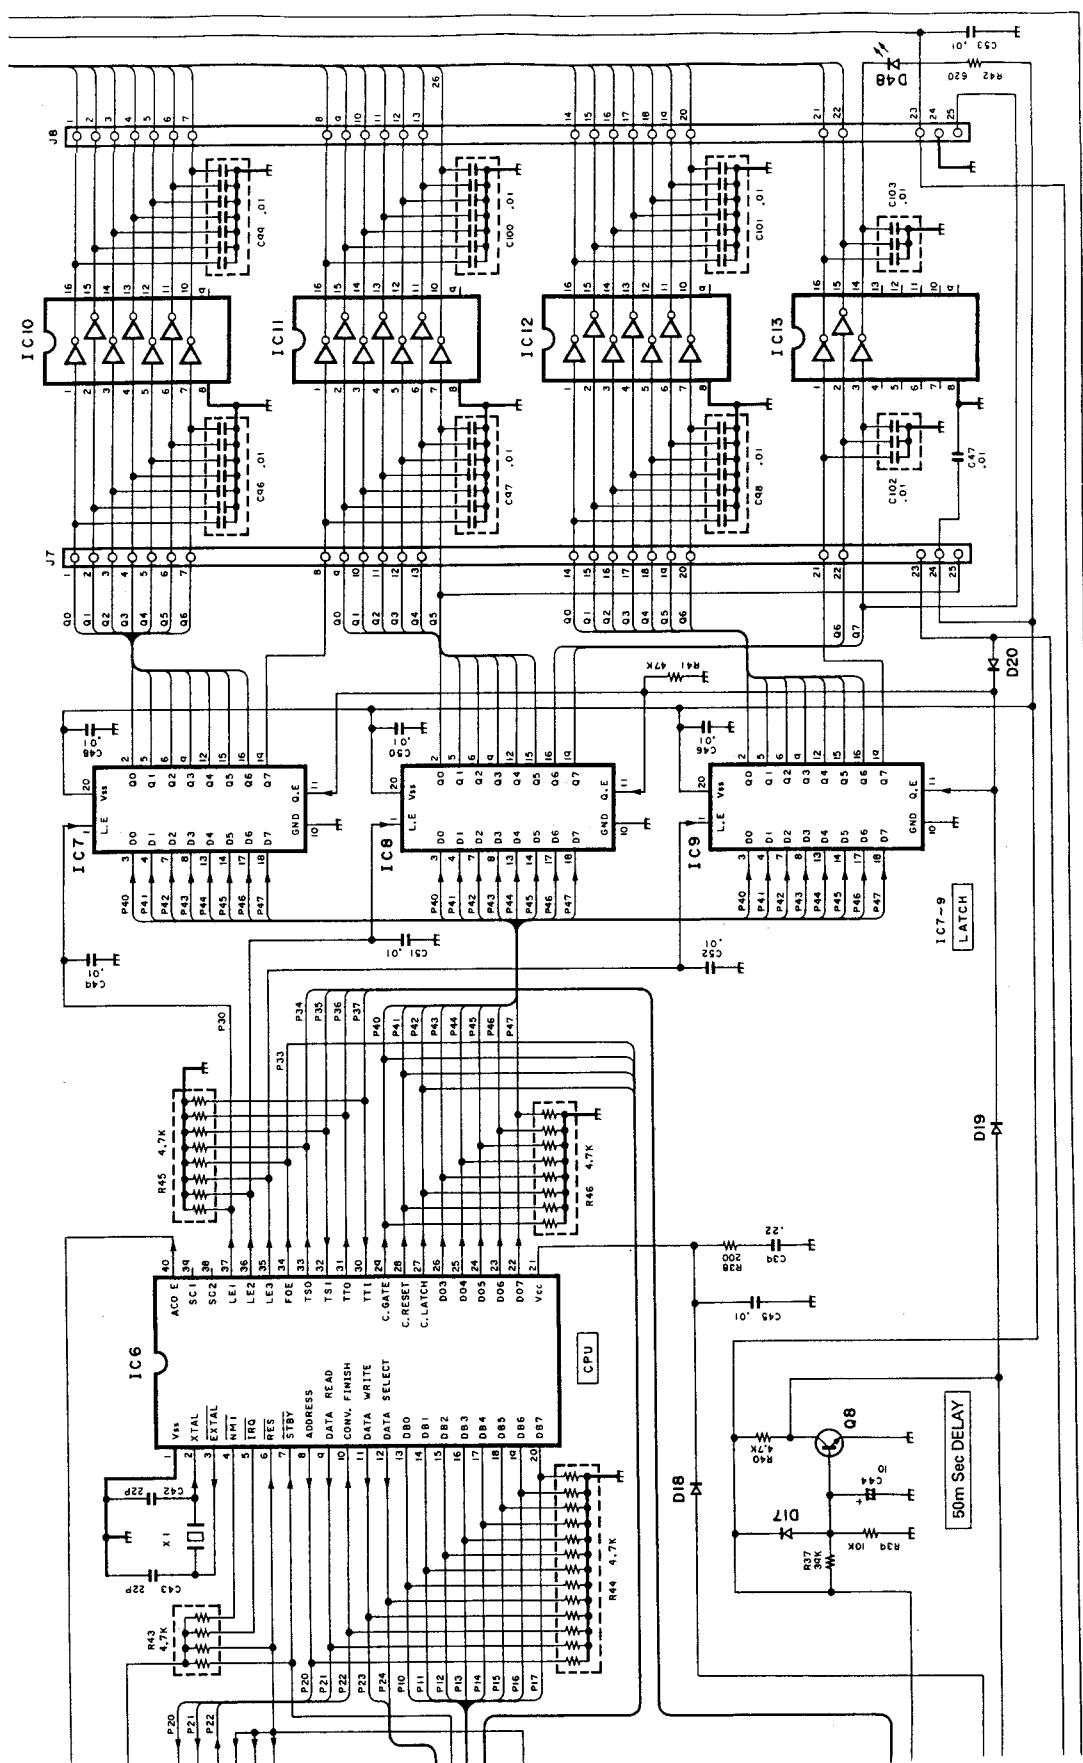

Fig. 8 Output block

MAT-100 (AUTOMATIC ANTENNA TUNER)

• Mode setting block

To set the CPU, terminals P20 through P22 of IC6 must be set high when activating the CPU. P20 through P22 control A/D converter IC4. Therefore, a signal is selected using IC5.

A reset signal is output from pin 5 of IC14 during mode selection. When the reset signal is added to the A, B, and C terminals of IC5, terminals X0, Y0, and Z0 are selected. The terminal level is output to terminals X, Y, and Z and added to the P20, P21, and P22 terminals of IC6.

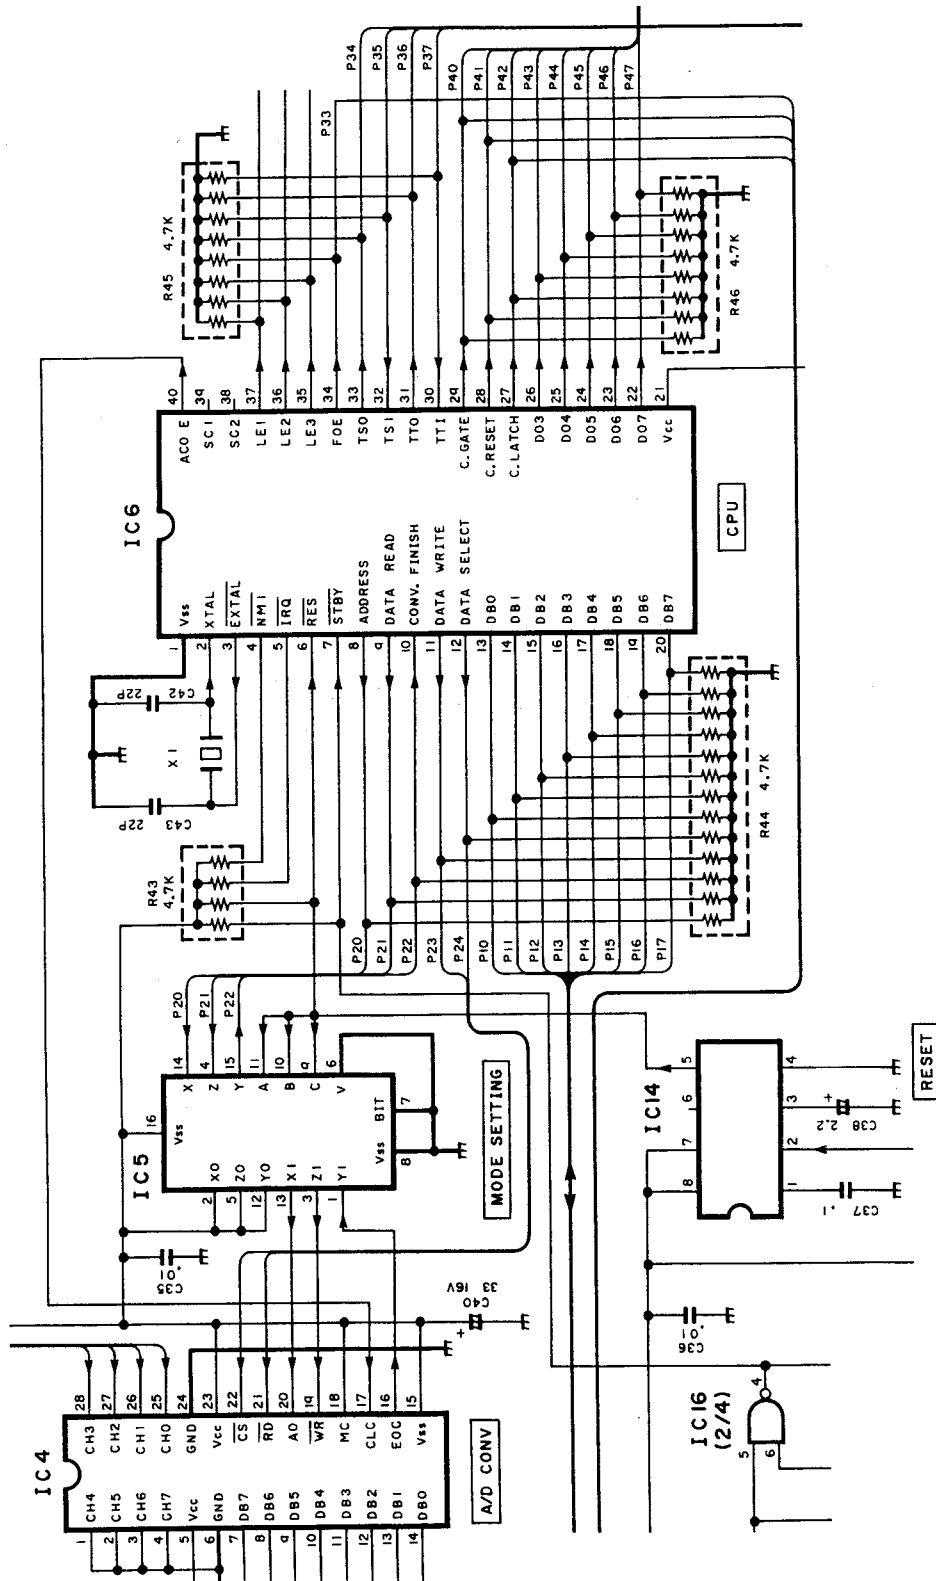

Fig. 9 Mode setting block

MAT-100 (AUTOMATIC ANTENNA TUNER)

- **CPU standby operation and interface**

The STBY signal is low and the CPU stops the clock oscillation, then enters the standby mode. When a TS or TT signal is set low in the standby mode, the TS signal sets the STBY signal high using Q4, IC16 (3/4), and IC16 (2/4). The TT signal sets the STBY signal high using Q6, IC16 (1/4), and IC16 (2/4).

The MAT-100 then exits the standby mode. When the STBY signal is set high, it is delayed by the time constant of R55 and C29, and pin 2 of IC14 is set high. When this terminal is set high, a reset signal (low) of the duration determined by C38 is output from pin 5.

When the reset signal is set high, the CPU starts operation. IC4 checks the P35 and P37 outputs, that is, the Q4 and Q6 outputs and judges whether the

drive signal is a TS or TT signal. A tuning or through operation is then performed.

When S4 is set to MANUAL, the STBY signal remains low by ORing diodes D13, D16, and R50. At this time, the CPU cannot be activated. A high signal is added to the base of Q8 via D12 during a power-on sequence, but it is delayed by the time constant determined by R37 and C44. This delay enables the STBY signal to be set high via D15 (D15, D9, and R35 are diode-ORed) using IC16 (3/4) and IC16 (2/4). This is done to initialize the CPU.

When the TS and TT signals are set high, the STBY signal is set low using Q4, Q6, IC16 (3/4), IC16 (1/4), and IC16 (2/4). The CPU thus enters the standby mode.

Fig. 10 Tuning start

MAT-100 (AUTOMATIC ANTENNA TUNER)

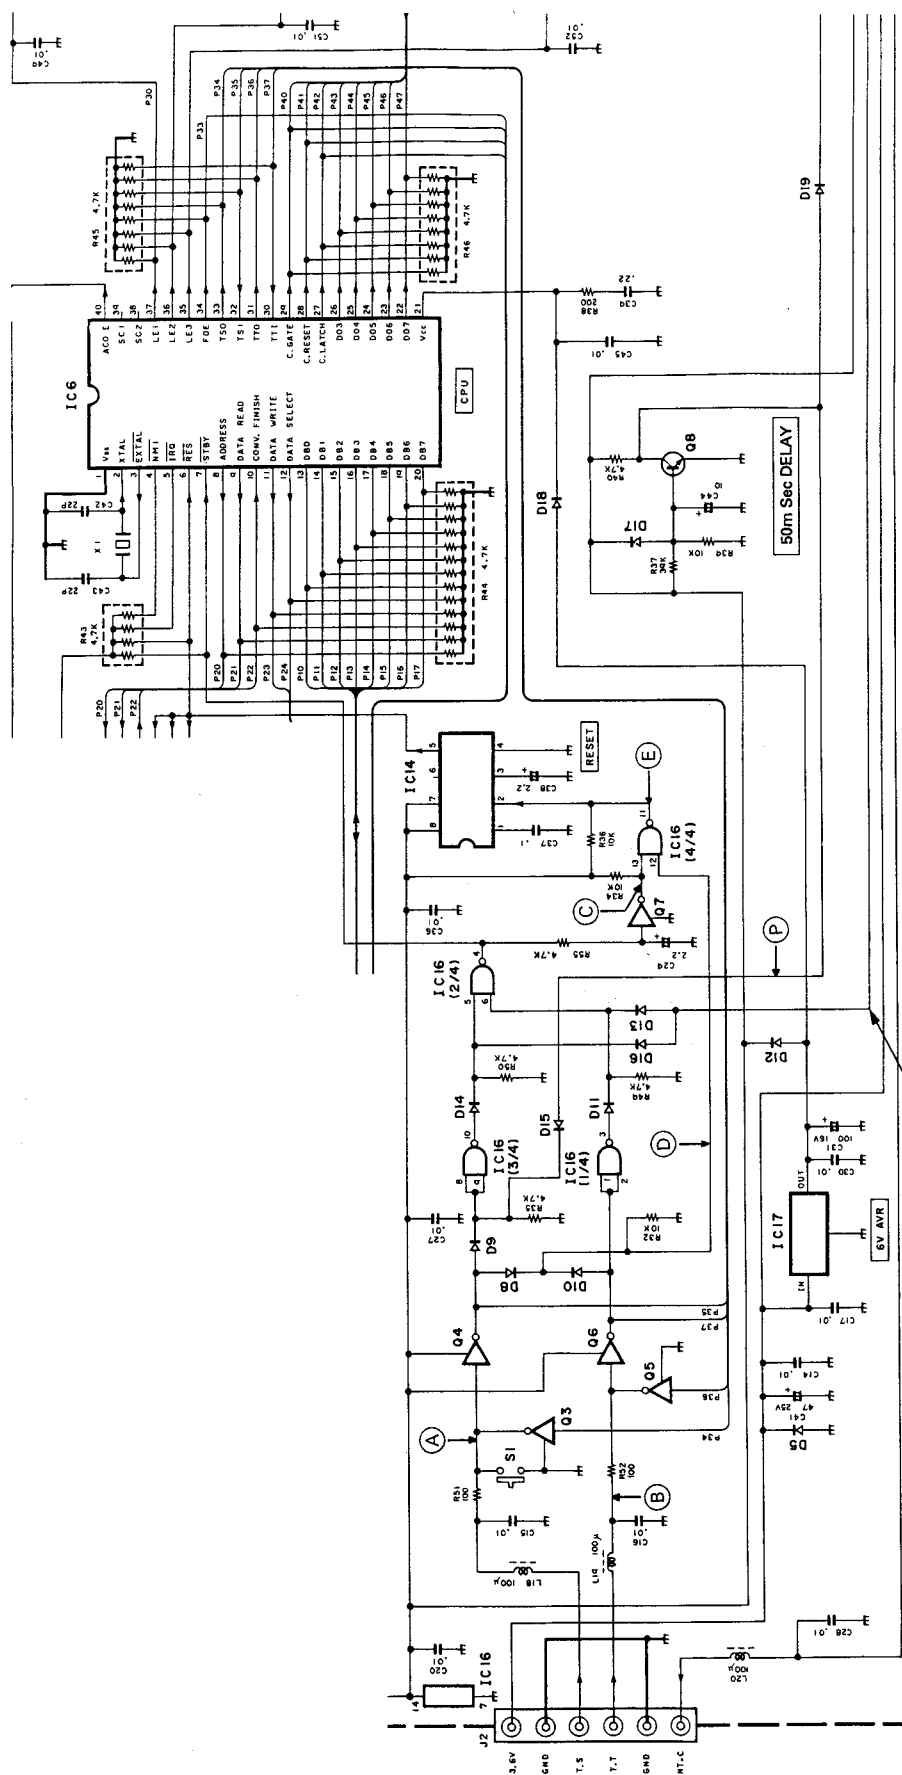

Fig. 11 Interface rest block

Auto : "L"
Manual : "H"

MAT-100 (AUTOMATIC ANTENNA TUNER)

- **LED unit**

This circuit consists of LED indicators D1 through D22, AUTO/MANUAL selector switch S4, and switches S1 through S3 to operate an LC tuning circuit relay during manual operation. LED indicators D1 through D22 go on when the corresponding LC tuning circuit relay is set on. The LED unit is also connected to J7 and J8 on the main unit's board via sockets J1 and J2.

AUTO or MANUAL is selected with switch S4. In the auto mode, ground (GND) is connected to pin 23 of J1 (output enable terminal of IC7, IC8, and IC9 on the main unit's board). In the manual mode, 5.3 V is connected to pin 23 of J1 as in auto mode.

In the manual mode, a voltage is applied to pins 1 through 22 of J1 (S1 through S3 are set to OFF). When switches S1 through S3 are set to ON, the voltage goes low. As a result, IC10 through IC13 on the main unit's board and the LC tuning circuit relay are activated.

1. Manual mode operation

When S1 through S3 set to OFF, the relay is set on and the corresponding LED indicator goes on.

When S1 through S3 are set to ON, the relay is set off and the corresponding LED indicator goes off.

2. Auto mode operation

The relay is set on and the corresponding LED indicator goes on irrespective of the setting of switches S1 through S3.

MAT-100 (AUTOMATIC ANTENNA TUNER)

Fig. 12 LED unit

TKM-707

MAT-100 (AUTOMATIC ANTENNA TUNER)

• LC tuning circuit

This circuit is used for antenna tuning. It consists of coils L1 through L11 to enable a false and linear change, capacitors C76 through C92, and relays K3 through

K24 to set capacitors on or off. Capacitors can be set to IN (TX) or OUT (ANT) by relays K12 and K15. These relays are driven by a signal from the CPU.

MAT-100 (AUTOMATIC ANTENNA TUNER)

The diagram illustrates the transmitter's internal components and their interconnections. Key sections include:

- Input and Matching:** The TX signal enters through a switch K1, passes through an ATT (attenuator) and a CUPLER (coupler) containing Q1, Q2, and D47. It then splits into an L NETWORK (L1 ~ L11, K3 ~ K11, K13, K14) and a C NETWORK (C76 ~ C92, K12, K15 ~ K24).
- Control and Timing:** A 90° Shift block feeds into IC1 (1/16), which is also connected to a POWER ON TIMMING block (Q8). IC16 (Q7) serves as the main control, receiving inputs from T.S (Tuning Sense) and T.T (Tuning Time) blocks (Q3/Q4 and Q5/Q6 respectively).
- Frequency and Mode Control:** The FREQ COUNT block (IC2, IC3) provides a signal to IC16. IC5 (MODE SELECT) and IC14 (RESET) also interface with the control logic.
- Processing and Output:** The signal path continues through a 90° Shift block, two mixers (D46, D47), and two comparators (IC15). The A/D converter (IC4) processes the signal, which is then sent to the LATCH (IC7, IC8, IC9) and DRIVE (IC10, IC11, IC12, IC13) stages. The final output is sent to the ANTENNA (ANT.C) via a switch K2 and a TUNE D48 diode.
- Power and Backup:** The system is powered by a 13.6V source, regulated by IC14 (Q7) to provide a +5.3V supply. A BACK UP unit (IC5) is connected to the CPU (P30 ~ P32, P10 ~ P17, P30 ~ P37, P34 ~ P37) for data retention.

MAT-100 (AUTOMATIC ANTENNA TUNER)

Description of Components

ANT MODULE UNIT (W02-0883-08)

Component	Use/Function	Operation/Condition/Compatibility
IC1	1/16 Divider	
IC2	1/16 Divider counter	BCD code.
IC3	Latch	High impedance level without frequency read.
IC4	A/D converter	CH0 FWD voltage. CH1 REF voltage. CH2 phase voltage. CH3 Impedance voltage.
IC5	CPU mode setting	CPU P20, 21, 22=High.
IC6	CPU	Single chip mode operation.
IC7~9	Output latch	Auto mode O, E=Low. Manual mode O, E=High.
IC10~13	Output driver	
IC14	Reset making	25ms.
IC15	Comparator	Phase is "+"=High, "-"=Low. IZ is 50Ω>High, 50Ω<Low
IC16	Switching	STBY, RESET TRIG occur.
IC17	AVR	6V 1A.
Q1, 2	Buffer	Q1 : REF wave, Q2 : FWD wave.
Q3, 5	Switching	Q3 : "H" level when through mode response. Q5 : "H" level when tune mode.
Q4, 6	Switching	Q4 : Turn to LOW when tune mode. Q6 : Turn to LOW when through mode.
Q7	Switching	RESET TRIG occur.
Q8	Switching	"H" 50m sec when power switch is turned ON.
Q9	Buffer	ELC level → TTL level.

LED UNIT (W02-0884-08)

Component	Use/Function	Operation/Condition/Compatibility
IC1~3	Voltage supply	Network between diode resistor.

Installation Instructions

• Antenna

The type of antenna that is used will greatly affect the performance of the equipment. The antenna should be erected as high as possible.

Keep the antenna as far from any object which may affect its performance, such as metallic masts or other guy wires, as possible.

Insulator should be able to withstand leakage even when wet.

The base of the antenna is **HIGH VOLTAGE**.

It should be connected to the lead-in insulator.

Do not touch the base of the antenna.

Certain lengths of antenna element are difficult for the system to tune.

Element length to be avoided

$= 300 / \text{operating frequency (MHz)} \times 1/2 \times \text{integer}$

SHIP STATION

FIXED STATION

VEHICLES

• Ground

The MAT-100 must be connected to a good electrical ground. Without a good ground an SSB radio-telephone cannot work satisfactorily. It is of the utmost importance to ground the antenna coupler unit.

If boat provides a good ground, use less than 2 m of heavy gauge wire to connect. To extend the length use a copper strap.

When good ground is not provided use a copper strap to run from the outside of the boat to the ground terminal of the antenna coupler.

SHIPS WITH A NON-CONDUCTING STRUCTURE

• Antenna coupler

INSTALLATION

The MAT-100 is protected by weather proof construction which permits the flexibility of interior or exterior installation.

Before installation note the following precaution.

1. Good ground connection
2. Avoid water spray
3. The base of the antenna is **HIGH VOLTAGE**.
4. Use caution when tightening the wing nut on the GND and antenna terminal. Over tightening may cause twisting of the terminals inside the coupler.

3. Installation by Hex Head Screws

Two drain holes are provided. If the coupler is installed horizontally remove screw A, and if installed vertically remove screw B.

Three kinds of installation are available for any type of ship.

1. Installation by U-clamp

2. Installation by Self tapping Screws

2. Installation by Self tapping Screws

TKM-707

MAT-100 (AUTOMATIC ANTENNA TUNER)

• Connection

WIRE FOR ANTENNA

The insulator must be relieved from mechanical stress by using a short flexible wire between the insulator and a support.

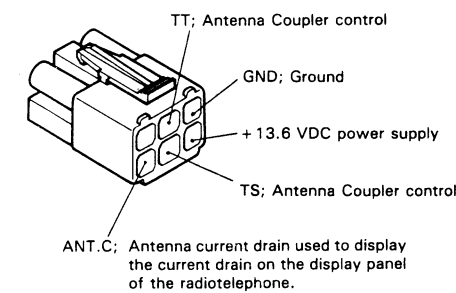

Lead-in insulator, such as GTO15 (15kV resisting presser) should be able to withstand high voltage.

CONTROL CABLES

The MAT-100 requires a control cable consisting of between 4-5 wires of at least AWG24 gauge. The cable must be shielded.

1. Connect the 6-pin plug to rear of the radiotelephone.

A 5 wire control cable is needed if you want to connect the ANT.C pin. Please refer to the MAT-100 Service Manual for further information on this function.

2. Strip the other side of the cable as shown below.

3. Connect the wires.
Be sure none of the wires are shorting against the others.

MAT-100 (AUTOMATIC ANTENNA TUNER)

4. Connect thru case of the Antenna coupler to Antenna connector of the radiotelephone with coaxial cable.

**TYPICAL INSTALLATION**

TKM-707

MAT-100 (AUTOMATIC ANTENNA TUNER)

Manual Tuning

If the control circuit in the MAT-100 does not function properly, should an emergency arise, you can still transmit on 2182 kHz ;The MARINE MOBILE EMERGENCY CHANNEL by switching the coupler to MANUAL OPERATION.

1. Turn the radiotelephone power switch off.
2. Remove the top cover of the antenna coupler.
3. Confirm S4 is in AUTO position.
- 4.. Turn the radiotelephone power switch on.
Press the 2182 key and then the TUNE key.
5. After completing the tuning, D48 LED indicator of the antenna coupler will light.
6. Record the status of D1to D22 LED indicators on or off.
7. Set the S4 slide switch to MANUAL position.
8. Set the S1 to S3 dip switch as the same position as step 6.
9. Change the S4 switch back forth between AUTO and MANUAL position to confirm no change in the D1to D22 LED indicators.
10. Set S4 to be AUTO position.
11. Attach the top cover of the antenna coupler.

MAT-100 (AUTOMATIC ANTENNA TUNER)**Specifications**

Frequency range	1.6 MHz to 30.0 MHz
Power Capability	150W PEP 100W continuous
Input Impedance	50 Ω
VSWR	less than 2.0
Tuning Power	10 W
Antenna Required	7 to 23 m(23 to 75 feet); 2 to 30 MHz 2.7m(9 feet)whip; 3.5 to 30 MHz
Tune-up Time	Within 2 to 15 sec (Within 0.5 sec on pre-tuned frequencies)
Power Supply requirement	13.6 VDC \pm 15% Negative Ground max2 A (supplied from radiotelephone)
Operating temperature	-30 °C to +60 °C (-4 °F to +140 °F)
Dimensions	W258×H425×D90 [mm]
Weight	3.0kg
Case Construction	Weather Proof
Control Cable	5 cables (Not supplied)

TKM-707

SPECIFICATIONS

Receiver Frequency range	500 kHz to 30.0 MHz
Transmitter Frequency range	2.0 to 2.9999 MHz 4.0 to 4.9999 MHz 6.0 to 6.9999 MHz 8.0 to 8.9999 MHz 12.0 to 12.9999 MHz 16.0 to 16.9999 MHz 22.0 to 22.9999 MHz
Mode	J3E,H3E
Antenna impedance	50 Ohms
Operating temperature	-30 °C to +60 °C (-4 °F to +140 °F)
Power requirement	13.6 VDC \pm 15%
Grounding	Negative
Current drain	RX max. less than 2 A TX max. less than 30 A
Frequency stability	\pm 20Hz(After 10 minutes warm up)
Dimensions	W270×H96×D270
Weight	5.1kg
Output power	HI ;150 W PEP MEDIUM ;50 W PEP LOW ;25 W PEP

Spurious radiation	less than 65 dB
Microphone impedance	600 Ω
Circuitry	Double conversion superheterodyne
Intermediate frequency	1st ; 71.295 MHz 2nd; 10.695 MHz
Sensitivity (12 dB SINAD)	500kHz~1.999MHz J3E;less than 1.0 μ V H3E;less than 5.6 μ V 2MHz~29.999MHz J3E;less than 0.5 μ V H3E;less than 2.8 μ V
Selectivity	-6dB J3E;more than 2.35kHz H3E;more than 6kHz -60dB J3E;less than 4.6kHz H3E;less than 20kHz
Spurious response	better than 70 dB
Output (10 % distortion)	more than 4 W
External speaker impedance	4 Ω
